<sup>8)</sup> Add  $I_{ST}$ , if  $I_{ST} > 0$ , add  $I_N$ , if  $V_{IN}>5.5\text{ V}$

<sup>9)</sup> Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

<sup>10)</sup> Short circuit current limit for max. duration of  $t_{d(SC)}$  max=450  $\mu\text{s}$ , prior to shutdown

<sup>11)</sup> Requires 150  $\Omega$  resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 2 and circuit page 7).

<sup>14)</sup> Low resistance short V<sub>bb</sub> to output may be detected in ON-state by the no-load-detection

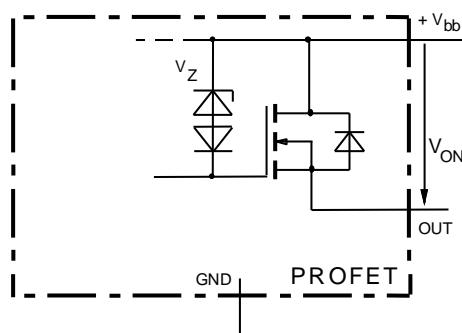

<sup>15)</sup> No current sink capability during undervoltage shutdown

## Short circuit detection

Fault Condition:  $V_{ON} > 8.5 \text{ V typ.}$ ; IN high

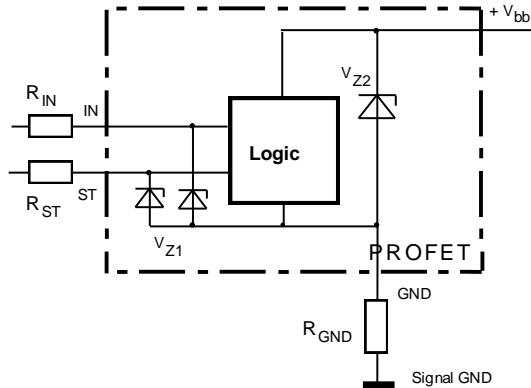

## Inductive and overvoltage output clamp

$V_{ON}$  clamped to 68 V typ.

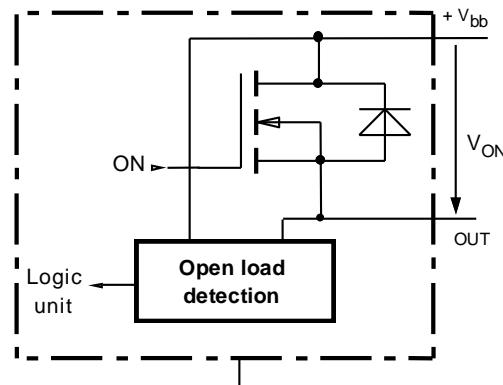

## Overvolt. and reverse batt. protection

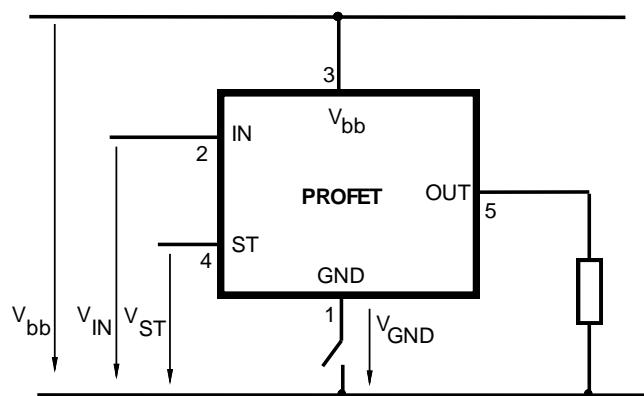

$V_{Z1} = 6.2 \text{ V typ.}$ ,  $V_{Z2} = 70 \text{ V typ.}$ ,  $R_{GND} = 150 \Omega$ ,  $R_{IN} = 15 \text{ k}\Omega$

Any kind of load. In case of Input=high is  $V_{OUT} \approx V_{IN} - V_{IN(T+)}$ . Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low signal available}$ .

## GND disconnect with GND pull up

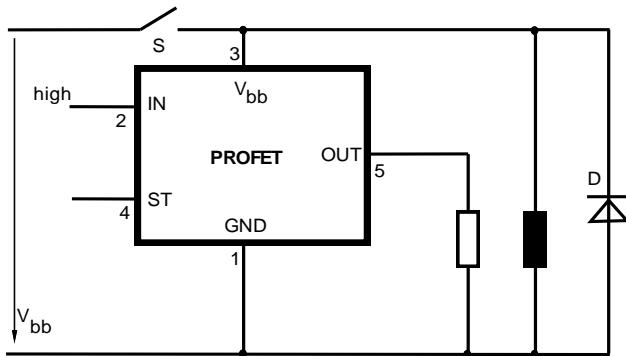

Any kind of load. If  $V_{GND} > V_{IN} - V_{IN(T+)}$  device stays off. Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low signal available}$ .

## V<sub>bb</sub> disconnect with energized inductive load

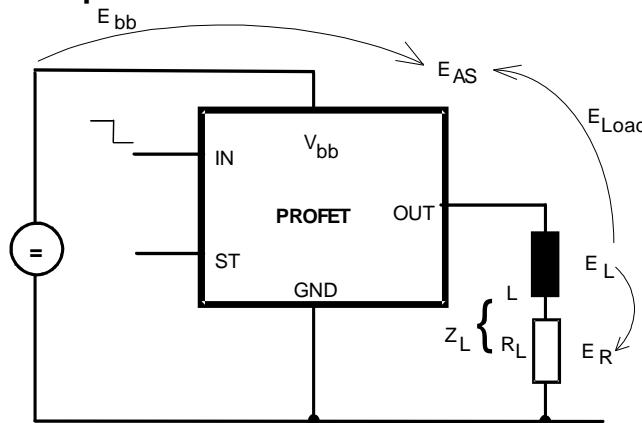

Normal load current can be handled by the PROFET itself.

## V<sub>bb</sub> disconnect with charged external inductive load

If other external inductive loads L are connected to the PROFET, additional elements like D are necessary.

## Inductive Load switch-off energy dissipation

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for  $R_L > 0 \Omega$ :

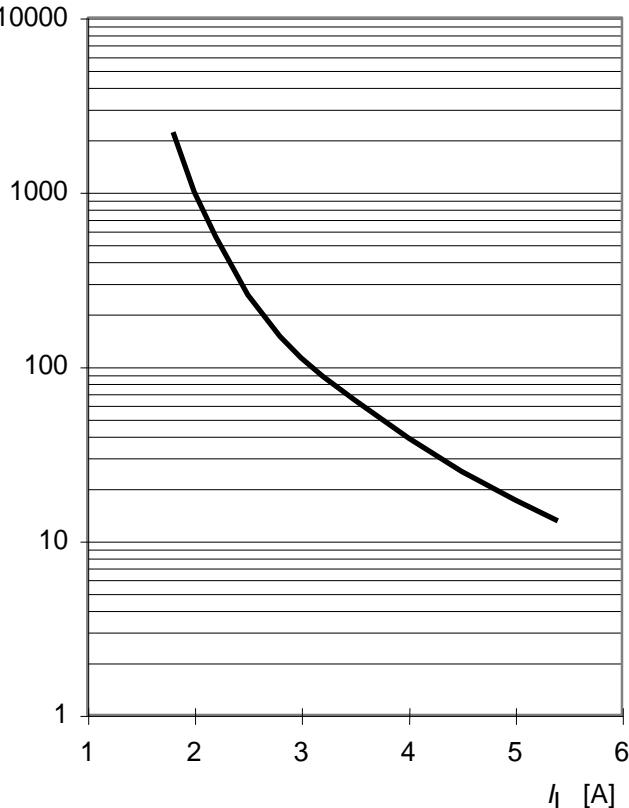

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} \cdot (V_{bb} + |V_{OUT(CL)}|) \cdot \ln \left( 1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

## Maximum allowable load inductance for a single switch off

$L = f(I_L)$ ;  $T_{j,start} = 150^\circ\text{C}$ ,  $T_C = 150^\circ\text{C}$  const.,

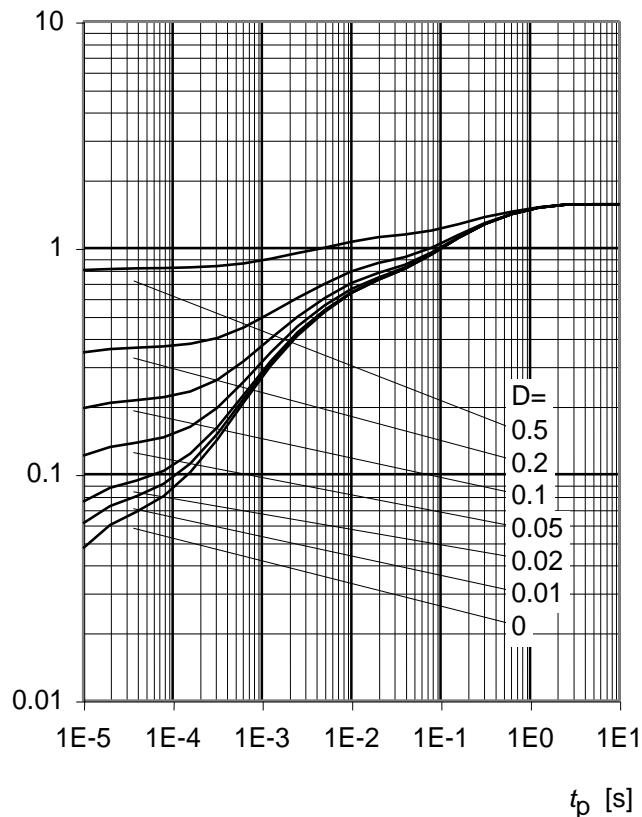

$V_{bb} = 12 \text{ V}$ ,  $R_L = 0 \Omega$

$L$  [mH]

**Typ. transient thermal impedance chip case**

$$Z_{\text{thJC}} = f(t_p, D), D=t_p/T$$

 $Z_{\text{thJC}}$  [K/W]
