

AWR1642 单芯片 77 和 79GHz FMCW 雷达传感器

1 器件概述

1.1 特性

- FMCW 收发器
 - 集成式 PLL、发送器、接收器、基带和 A2D
 - 76 至 81GHz 覆盖范围，具有 4GHz 的可用带宽
 - 四个接收通道
 - 两个发送通道
 - 基于分数 N PLL 的超精确线性调频脉冲（计时）引擎
 - TX 功率：12.5dBm
 - RX 噪声系数：
 - 14dB（76 至 77GHz）
 - 15dB（77 至 81GHz）
 - 1MHz 时的相位噪声：
 - -95dBc/Hz（76 至 77GHz）
 - -93dBc/Hz（77 至 81GHz）
- 内置的校准和自检（监控）
 - 配备基于 ARM® Cortex® 基于 ARM® Cortex®-R4F 的无线电控制系统
 - 内置的固件 (ROM)
 - 针对频率和温度进行自校准的系统
- 用于 FMCW 信号处理的 C674x DSP
- 片上存储器：1.5MB
- 用于物体跟踪和分类、AUTOSAR 和接口控制的 Cortex-R4F 微控制器
 - 支持自主模式（从 QSPI 闪存加载用户应用）
- 集成外设
 - 具有 ECC 的内部存储器
- 主机接口
 - CAN（两个实例，其中一个是 CAN-FD）
- 为用户应用提供的其他接口
 - 多达 6 个 ADC 通道
 - 多达 2 个 SPI 通道
 - 多达 2 个 UART
 - I²C
 - GPIO
 - 用于原始 ADC 数据和调试仪表的 2 通道 LVDS 接口
- 以 ASIL B 级为目标
- 符合 AECQ100 标准
- AWR1642 高级特性
 - 嵌入式自监控，无需使用主机处理器
 - 复基带架构
 - 嵌入式干扰检测功能
- 电源管理
 - 内置的 LDO 网络，可增强 PSRR
 - I/O 支持双电压 3.3V/1.8V
- 时钟源
 - 支持频率为 40MHz 的外部振荡器
 - 支持外部驱动、频率为 40MHz 的时钟（方波/正弦波）
 - 支持 40MHz 晶体与负载电容器相连接
- 轻松的硬件设计
 - 0.65mm 间距、161 引脚 10.4mm x 10.4mm 覆晶 BGA 封装，可实现轻松组装和低成本 PCB 设计
 - 小尺寸解决方案
- 支持汽车运行温度范围

1.2 应用

- 盲点检测
- 变道辅助
- 侧向来车警示
- 泊车辅助
- 占位检测
- 简单手势识别
- 车门开启器 应用

1.3 说明

AWR1642 器件是一款能够在 76 至 81GHz 频带中运行的集成式单芯片 FMCW 雷达传感器。该器件采用 TI 的低功耗 45nm RFCMOS 工艺进行构建，并且在极小的封装中实现了前所未有的集成度。AWR1642 是适用于汽车领域中的低功耗、自监控、超精确雷达系统的理想解决方案。

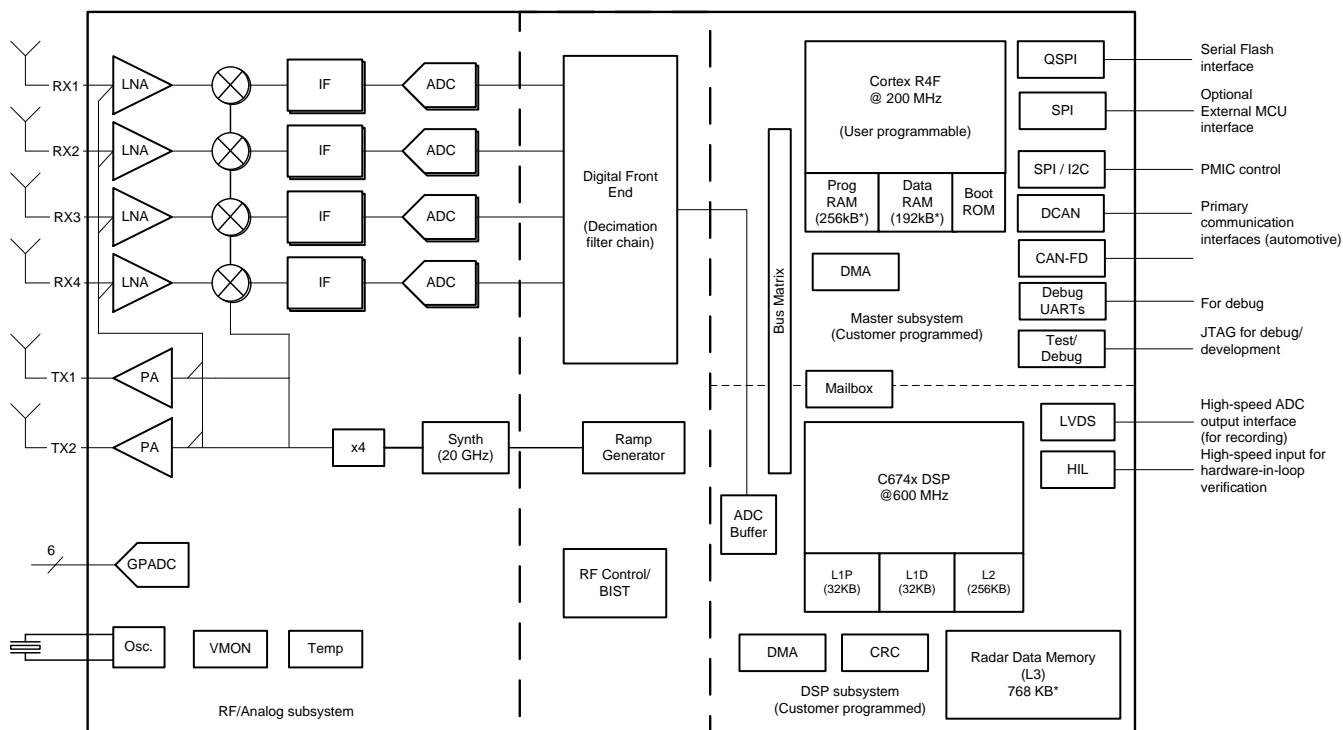

AWR1642 器件是一种自包含 FMCW 雷达传感器单芯片解决方案，能够简化 76 至 81GHz 频带中的汽车雷达传感器实施。它构建在 TI 的低功耗 45nm RFCMOS 工艺之上，从而实现了一个具有内置 PLL 和模数转换器的单片实施 2TX、4RX 系统。它集成了 DSP 子系统，该子系统包含 TI 用于雷达信号处理的高性能 C674x DSP。该器件包含一个基于 ARM R4F 的处理器子系统，该子系统负责无线电配置、控制和校准。简单编程模型更改可支持各种传感器实施（近距离、中距离和远距离），并且能够进行动态重新配置，从而实现多模式传感器。此外，该器件作为完整的平台解决方案进行提供，该解决方案包括硬件参考设计、软件驱动程序、样例配置、API 指南以及用户文档。

Changes from May 1, 2017 to April 30, 2018 (from * Revision (May 2017) to A Revision)	Page
• 将文档中的“预告信息”更新/更改成了“生产数据”	1
• 将 TX 功率从“12dBm”更新/更改成了“12.5 dBm”	1
• 将 RX 噪声系数从“15dB (76 至 77GHz)”更新/更改成了“14dB (76 至 77GHz)”	1
• 将 RX 噪声系数从“16dB (77 至 81GHz)”更新/更改成了“15dB (77 至 81GHz)”	1
• 将 1MHz 时的相位噪声从“-94dBc/Hz (76 至 77GHz)”更新/更改成了“-95dBc/Hz (76 至 77GHz)”	1
• 将 1MHz 时的相位噪声从“-91dBc/Hz (77 至 81GHz)”更新/更改成了“-93dBc/Hz (77 至 81GHz)”	1
• 将“特性”中的“符合 ASIL B 级要求”更新/更改成了“以 ASIL B 级为目标”	1
• 删除了“具有内部振荡器的 40.0MHz 晶体”项目	1
• 将“特性”中的“频率为 40 和 50MHz 的外部振荡器”更新/更改成了“频率为 40MHz 的外部振荡器”	1
• 将“特性”中的“...驱动、频率为 40 和 50MHz 的时钟（方波/正弦波）”更新/更改成了“...驱动、频率为 40MHz 的时钟（方波/正弦波）”	1
• 添加了“支持 40MHz 晶体...相连接”	1
• 更新了功能框图中的 RX 和 TX 连接	3
• 在功能框图中添加了 GPADC 框	3
• 将功能框图脚注文本中的“576KB”更新/更改成了“512KB”	3
• Added AWR1243P to Device Features Comparison	7
• Updated/Changed Device Features Comparison ASIL for AWR1243P, AWR1243, and AWR1642 from "B-Capable" to "B-Targeted"	7
• Added "Max complex sampling rate (Msps)" to Device Features Comparison	7
• Corrected A10 pin to "VOUT_14APLL"	10
• Updated Top Right Quadrant image to match complete Pin Diagram	12
• Updated/Changed N14 from GPIO48 to DMM_SYNC	16
• Added two register tables after Pin Attributes	21
• Updated/Changed PAD IO Control Registers	21
• Updated/Changed CLKP and CLKM descriptions in <i>Signal Descriptions</i>	27
• Removed R14 from Power supply VIOIN	27
• Added pin R15 to Power supply VSS	28
• Added footnote to $V_{(ESD)}$	29
• Updated/Changed V_{IL} in Recommended Operating Conditions	30
• Updated/Changed V_{OH} MIN from "85% VIOIN" to "VIOIN - 450"	30
• Deleted CLKP and CLKM row in <i>Recommended Operating Conditions</i>	30
• Updated/Changed V_{OL} MAX from "350" to "450"	30
• Added NRESET row to Recommended Operating Conditions	30
• Completely updated Ripple Specifications table	31
• Updated/Changed Current consumption from "Total current drawn by all nodes driven by 1.3V rail" to "Total current drawn by all nodes driven by 1.3V or 1.0V rails"	31
• Updated Average Power Consumption at Power Terminals	31
• Added footnote to RF Specification	32
• Updated/Changed RF Specification Receiver from "... (Out of Band)..." to "... (Out of Band / Specified at 10 kHz)..."	32
• Updated/Changed RF Specification Receiver 1-dB compression Point from "-5 dBm" to "-8 dBm"	32
• Updated/Changed RF Specification Receiver from "IQ gain mismatch" to "Image Rejection Ratio (IMRR)"	32
• Removed IQ phase mismatch from RF Specification	32
• Updated/Changed RF Specification Receiver from "A2D sampling rate (complex)" to "A2D sampling rate (complex 1x)"	32
• Added multiple row to RF Specification Receiver	32
• Updated/Changed Power Supply Sequencing and Reset Timing image	34
• Updated/Changed <i>Crystal Implementation</i> image from "40 and 50 MHz" to "40 MHz"	35
• Updated/Changed <i>Crystal Implementation</i> text from "XTALP" and "XTALM" to "CLKP" and "CLKM"	35
• Updated Frequency tolerance from ± 50 to ± 200	35
• Added <i>External Clock Electrical Characteristics</i>	36
• Added External Clock Mode Specifications	36
• Updated SPI Slave Mode Switching Parameters	42
• Updated SPI Slave Mode Timing Requirements	42
• Updated/Changed QSPI Timing Requirements $t_{su(D-SCLK)}$ MIN value from "6.3" to "7.3"	52

• Updated/Changed QSPI Timing Requirements $t_{h(SCLK-D)}$ MIN value from "1" to "1.5"	52
• Updated/Changed QSPI Timing Requirements $t_{su(D-SCLK)}$ MIN value from "6.2 – P" to "7.3 – P"	52
• Updated/Changed QSPI Timing Requirements $t_{h(SCLK-D)}$ MIN value from "1 + P" to "1.5 + P"	52
• Added Q12, Q13, Q14, and Q15 to QSPI Switching Characteristics	53
• Updated/Changed <i>Clock Subsystem</i> diagram.....	59
• Updated/Changed Recieve Subsystem text from "...cutoff frequencies above 350 kHz..." to "...cutoff frequencies above 175 kHz..."	60
• Removed "...and ENOB of ~9 bits" from ADC Channels (Service) for User Application	66
• Updated/Changed text from "ADC channel mapped to B12" to "GPADC channel 6"	66
• Updated/Changed <i>GP-ADC Parameter</i> table	66
• Updated/Changed S No 1 in Monitoring and Diagnostic Mechanisms.....	67
• Deleted S No 6 from Monitoring and Diagnostic Mechanisms	67
• Updated/Changed Device Nomenclature	80

The following list describes the table column headers:

- BALL NUMBER:** Ball numbers on the bottom side associated with each signal on the bottom.
- BALL NAME:** Mechanical name from package device (name is taken from muxmode 0).
- SIGNAL NAME:** Names of signals multiplexed on each ball (also notice that the name of the ball is the signal name in muxmode 0).
- PINCNTL ADDRESS:** MSS Address for PinMux Control
- MODE:** Multiplexing mode number: value written to PinMux Cntl register to select specific Signal name for this Ball number. Mode column has bit range value.
- TYPE:** Signal type and direction:
 - I = Input
 - O = Output

- IO = Input or Output
- 7. **BALL RESET STATE:** The state of the terminal at power-on reset
- 8. **PULL UP/DOWN TYPE:** indicates the presence of an internal pullup or pulldown resistor. Pullup and pulldown resistors can be enabled or disabled via software.
 - Pull Up: Internal pullup
 - Pull Down: Internal pulldown
 - An empty box means No pull.
- 9. Pin Mux Control Value maps to lower 4 bits of register.

IO MUX registers are available in the MSS memory map and the respective mapping to device pins is as follows:

VIN_18BB	1.8-V Analog baseband power supply	–0.5	2	V
VIN_18VCO supply	1.8-V RF VCO supply	–0.5	2	V
Input and output voltage range	Dual-voltage LVCMOS inputs, 3.3 V or 1.8 V (Steady State)	–0.3V	VIOIN + 0.3	V
	Dual-voltage LVCMOS inputs, operated at 3.3 V/1.8 V (Transient Overshoot/Undershoot) or external oscillator input	VIOIN + 20% up to 20% of signal period		
CLKP, CLKM	Input ports for reference crystal	–0.5	2	V
Clamp current	Input or Output Voltages 0.3 V above or below their respective power rails. Limit clamp current that flows through the internal diode protection cells of the I/O.	–20	20	mA
T _J	Operating junction temperature range	–40	125	°C
T _{STG}	Storage temperature range after soldered onto PC board	–55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to V_{SS}, unless otherwise noted.

5.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±1000
		Charged-device model (CDM), per AEC Q100-011 ⁽²⁾	±250

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.
- (2) Corner pins are rated as ±750 V

5.3 Power-On Hours (POH)⁽¹⁾

JUNCTION TEMPERATURE (T _J)	OPERATING CONDITION	NOMINAL CVDD VOLTAGE (V)	POWER-ON HOURS [POH] (HOURS)
–40°C	100% duty cycle	1.2	600 (6%)

(1) Specification is quoted for complex 1x mode.

(2) The analog IF stages include high-pass filtering, with two independently configurable first-order high-pass corner frequencies. The set of available HPF corners is summarized as follows:

Available HPF Corner Frequencies (kHz)

HPF1	HPF2
175, 235, 350, 700	350, 700, 1400, 2800

The filtering performed by the baseband chain is targeted to provide:

- Less than ±0.5 dB pass-band ripple/droop, and
- Better than 60 dB anti-aliasing attenuation for any frequency that can alias back into the pass-band.

Figure 5-1 shows variations of noise figure and in-band P1dB parameters with respect to receiver gain programmed.

5.10 Timing and Switching Characteristics

5.10.1 Power Supply Sequencing and Reset Timing

The AWR1642 device expects all external voltage rails to be stable before reset is deasserted. Figure 5-2 describes the device wake-up sequence.

(1) MCU_CLK_OUT in autonomous mode, where AWR1642 application is booted from the serial flash, MCU_CLK_OUT is not enabled by default by the device bootloader.

Figure 5-2. Device Wake-up Sequence

5.10.2 Input Clocks and Oscillators

5.10.2.1 Clock Specifications

The AWR1642 requires external clock source (that is, a 40-MHz crystal) for initial boot and as a reference for an internal APLL hosted in the device. An external crystal is connected to the device pins. Figure 5-3 shows the crystal implementation.

Figure 5-3. Crystal Implementation

NOTE

The load capacitors, C_{f1} and C_{f2} in Figure 5-3, should be chosen such that Equation 1 is satisfied. C_L in the equation is the load specified by the crystal manufacturer. All discrete components used to implement the oscillator circuit should be placed as close as possible to the associated oscillator CLKP and CLKM pins.

$$C_L = C_{f1} \times \frac{C_{f2}}{C_{f1} + C_{f2}} + C_P \quad (1)$$

Table 5-5 lists the electrical characteristics of the clock crystal.

Table 5-5. Crystal Electrical Characteristics (Oscillator Mode)

(1) The crystal manufacturer's specification must satisfy this requirement.

(2) Includes initial tolerance of the crystal, drift over temperature, aging and frequency pulling due to incorrect load capacitance.

In the case where an external clock is used as the clock resource, the signal is fed to the CLKP pin only; CLKM is grounded. The phase noise requirement is very important when a 40-MHz clock is fed externally. [Table 5-6](#) lists the electrical characteristics of the external clock signal.

5.10.3 Multibuffered / Standard Serial Peripheral Interface (MibSPI)

5.10.3.1 Peripheral Description

The MibSPI/SPI is a high-speed synchronous serial input/output port that allows a serial bit stream of programmed length (2 to 16 bits) to be shifted into and out of the device at a programmed bit-transfer rate. The MibSPI/SPI is normally used for communication between the microcontroller and external peripherals or another microcontroller.

Standard and MibSPI modules have the following features:

- 16-bit shift register
- Receive buffer register
- 8-bit baud clock generator
- SPICLK can be internally-generated (master mode) or received from an external clock source (slave mode)
- Each word transferred can have a unique format.
- SPI I/Os not used in the communication can be used as digital input/output signals

5.10.3.2 MibSPI Transmit and Receive RAM Organization

The Multibuffer RAM is comprised of 256 buffers. Each entry in the Multibuffer RAM consists of 4 parts: a 16-bit transmit field, a 16-bit receive field, a 16-bit control field and a 16-bit status field. The Multibuffer RAM can be partitioned into multiple transfer group with variable number of buffers each.

5.10.3.4 Typical Interface Protocol Diagram (Slave Mode)

1. Host should ensure that there is a delay of two SPI clocks between CS going low and start of SPI clock.
2. Host should ensure that CS is toggled for every 16 bits of transfer through SPI.

Figure 5-10 shows the SPI communication timing of the typical interface protocol.

Figure 5-10. SPI Communication

5.10.4 LVDS Interface Configuration

The AWR1642 supports four differential LVDS IOs/Lanes. The lane configuration supported is two Data lanes (LVDS_TXP/M), one Bit Clock lane (LVDS_CLKP/M) and one Frame clock lane (LVDS_FRCLKP/M). The LVDS interface supports the following data rates:

- 900 Mbps (450 MHz DDR Clock)
- 600 Mbps (300 MHz DDR Clock)
- 450 Mbps (225 MHz DDR Clock)
- 400 Mbps (200 MHz DDR Clock)
- 300 Mbps (150 MHz DDR Clock)
- 225 Mbps (112.5 MHz DDR Clock)
- 150 Mbps (75 MHz DDR Clock)

Note that the bit clock is in DDR format and hence the numbers of toggles in the clock is equivalent to data.

5.10.4.1 LVDS Interface Timings

Calculation showing tw parameters:

Freq = 900MHz, Period = 1.11ns
 At 50% $twH1/twL1 = 1.11ns/2 = 0.55ns$
 Rise time = Fall time = 200ps (as per LVDS IO spec @1pF load)
 $twH2/twL2 = (1.11ns - 2 * 200ps) / 2 = 0.35ns$

(1) Slew control, which is configured by PADxx_CFG_REG, changes behavior of the output driver (faster or slower output slew rate).

(2) The rise/fall time is measured as the time taken by the signal to transition from 10% and 90% of VIOIN voltage.

5.10.6 Controller Area Network Interface (DCAN)

The DCAN supports the CAN 2.0B protocol standard and uses a serial, multimaster communication protocol that efficiently supports distributed real-time control with robust communication rates of up to 1 Mbps. The DCAN is ideal for applications operating in noisy and harsh environments that require reliable serial communication or multiplexed wiring.

The DCAN has the following features:

- Supports CAN protocol version 2.0 part A, B
- Bit rates up to 1 Mbps
- Configurable Message objects
- Individual identifier masks for each message object
- Programmable FIFO mode for message objects
- Suspend mode for debug support
- Programmable loop-back modes for self-test operation
- Direct access to Message RAM in test mode
- Supports two interrupt lines - Level 0 and Level 1
- Automatic Message RAM initialization

Table 5-16. Dynamic Characteristics for the DCANx TX and RX Pins

PARAMETER		MIN	TYP	MAX	UNIT
$t_{d(CAN_tx)}$	Delay time, transmit shift register to CAN_tx pin ⁽¹⁾			15	ns
$t_{d(CAN_rx)}$	Delay time, CAN_rx pin to receive shift register ⁽¹⁾			10	ns

(1) These values do not include rise/fall times of the output buffer.

5.10.7 Controller Area Network - Flexible Data-rate (CAN-FD)

The CAN-FD module supports both classic CAN and CAN FD (CAN with Flexible Data-Rate) specifications. CAN FD feature allows high throughput and increased payload per data frame. The classic CAN and CAN FD devices can coexist on the same network without any conflict.

The CAN-FD has the following features:

- Conforms with CAN Protocol 2.0 A, B and ISO 11898-1
- Full CAN FD support (up to 64 data bytes per frame)
- AUTOSAR and SAE J1939 support
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO, up to 32 elements
- Configurable Transmit Queue, up to 32 elements
- Configurable Transmit Event FIFO, up to 32 elements
- Up to 64 dedicated Receive Buffers
- Two configurable Receive FIFOs, up to 64 elements each
- Up to 128 11-bit filter elements
- Internal Loopback mode for self-test
- Mask-able interrupts, two interrupt lines
- Two clock domains (CAN clock / Host clock)
- Parity / ECC support - Message RAM single error correction and double error detection (SECEDED) mechanism
- Full Message Memory capacity (4352 words).

Table 5-17. Dynamic Characteristics for the DCANx TX and RX Pins

PARAMETER		MIN	TYP	MAX	UNIT
$t_{d(CAN_FD_tx)}$	Delay time, transmit shift register to CAN_FD_tx pin ⁽¹⁾			15	ns

(1) These values do not include rise/fall times of the output buffer.

5.10.8 Serial Communication Interface (SCI)

The SCI has the following features:

- Standard universal asynchronous receiver-transmitter (UART) communication
- Standard non-return to zero (NRZ) format
- Double-buffered receive and transmit functions
- Asynchronous or iso-synchronous communication modes with no CLK pin
- Capability to use Direct Memory Access (DMA) for transmit and receive data
- Two external pins: RS232_RX and RS232_TX

Table 5-18. SCI Timing Requirements

		MIN	TYP	MAX	UNIT
f(baud)	Supported baud rate at 20 pF		921.6		kHz

5.10.9 Inter-Integrated Circuit Interface (I2C)

The inter-integrated circuit (I2C) module is a multimaster communication module providing an interface between devices compliant with Philips Semiconductor I2C-bus specification version 2.1 and connected by an I²C-bus™. This module will support any slave or master I2C compatible device.

The I2C has the following features:

- Compliance to the Philips I2C bus specification, v2.1 (The I2C Specification, Philips document number 9398 393 40011)
 - Bit/Byte format transfer
 - 7-bit and 10-bit device addressing modes
 - General call
 - START byte
 - Multi-master transmitter/ slave receiver mode
 - Multi-master receiver/ slave transmitter mode
 - Combined master transmit/receive and receive/transmit mode
 - Transfer rates of 100 kbps up to 400 kbps (Phillips fast-mode rate)
- Free data format
- Two DMA events (transmit and receive)
- DMA event enable/disable capability
- Module enable/disable capability
- The SDA and SCL are optionally configurable as general purpose I/O
- Slew rate control of the outputs
- Open drain control of the outputs
- Programmable pullup/pulldown capability on the inputs
- Supports Ignore NACK mode

NOTE

This I2C module does not support:

- High-speed (HS) mode
 - C-bus compatibility mode
 - The combined format in 10-bit address mode (the I2C sends the slave address second byte every time it sends the slave address first byte)
-

Table 5-19. I2C Timing Requirements⁽¹⁾

		STANDARD MODE		FAST MODE		UNIT
		MIN	MAX	MIN	MAX	
$t_{c(SCL)}$	Cycle time, SCL	10		2.5		μs
$t_{su(SCLH-SDAL)}$	Setup time, SCL high before SDA low (for a repeated START condition)	4.7		0.6		μs
$t_{h(SCLL-SDAL)}$	Hold time, SCL low after SDA low (for a START and a repeated START condition)	4		0.6		μs
$t_{w(SCLL)}$	Pulse duration, SCL low	4.7		1.3		μs
$t_{w(SCLH)}$	Pulse duration, SCL high	4		0.6		μs
$t_{su(SDA-SCLH)}$	Setup time, SDA valid before SCL high	250		100		μs
$t_{h(SCLL-SDA)}$	Hold time, SDA valid after SCL low	0	3.45 ⁽¹⁾	0	0.9	μs
$t_{w(SDAH)}$	Pulse duration, SDA high between STOP and START conditions	4.7		1.3		μs
$t_{su(SCLH-SDAH)}$	Setup time, SCL high before SDA high (for STOP condition)	4		0.6		μs
$t_{w(SP)}$	Pulse duration, spike (must be suppressed)			0	50	ns
$C_b^{(2)(3)}$	Capacitive load for each bus line		400		400	pF

- (1) The I2C pins SDA and SCL do not feature fail-safe I/O buffers. These pins could potentially draw current when the device is powered down.
- (2) The maximum $t_h(SDA-SCLL)$ for I2C bus devices has only to be met if the device does not stretch the low period ($t_w(SCLL)$) of the SCL signal.
- (3) C_b = total capacitance of one bus line in pF. If mixed with fast-mode devices, faster fall-times are allowed.

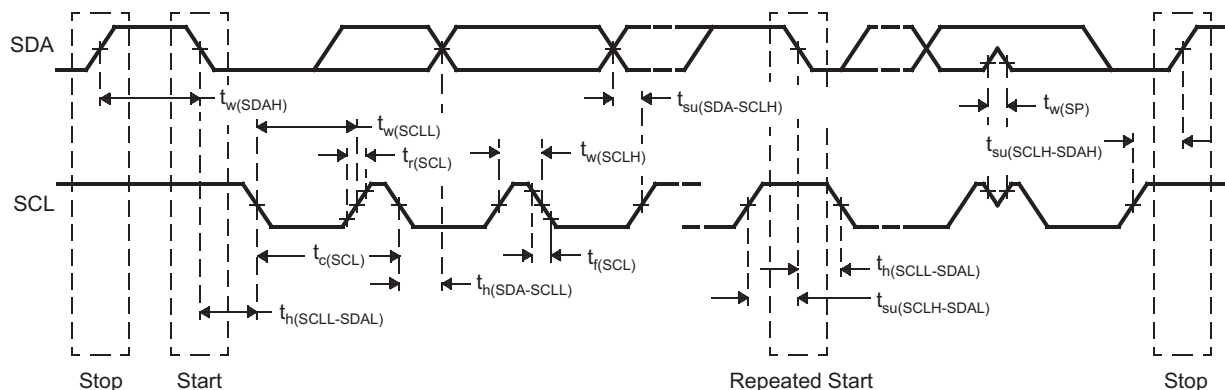

Figure 5-13. I2C Timing Diagram

NOTE

- A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- The maximum $t_h(SDA-SCLL)$ has only to be met if the device does not stretch the LOW period ($t_w(SCLL)$) of the SCL signal. E.A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement $t_{su(SDA-SCLH)} \geq 250$ ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_r \max + t_{su(SDA-SCLH)}$.

5.10.10 Quad Serial Peripheral Interface (QSPI)

The quad serial peripheral interface (QSPI™) module is a kind of SPI module that allows single, dual, or quad read access to external SPI devices. This module has a memory mapped register interface, which provides a direct interface for accessing data from external SPI devices and thus simplifying software requirements. The QSPI works as a master only. The QSPI in the device is primarily intended for fast booting from quad-SPI flash memories.

The QSPI supports the following features:

- Programmable clock divider
- Six-pin interface
- Programmable length (from 1 to 128 bits) of the words transferred
- Programmable number (from 1 to 4096) of the words transferred
- Support for 3-, 4-, or 6-pin SPI interface
- Optional interrupt generation on word or frame (number of words) completion
- Programmable delay between chip select activation and output data from 0 to 3 QSPI clock cycles

Table 5-21 and Table 5-22 assume the operating conditions stated in Table 5-20.

(1) Clock Mode 0 (clk polarity = 0 ; clk phase = 0) is the mode of operation.

(2) The Device captures data on the falling clock edge in Clock Mode 0, as opposed to the traditional rising clock edge. Although non-standard, the falling-edge-based setup and hold time timings have been designed to be compatible with standard SPI sevicees that launch data on the falling edge in Clock Mode 0.

(3) P = SCLK period in ns.

- (1) The Y parameter is defined as follows: If DCLK_DIV is 0 or ODD then, Y equals 0.5. If DCLK_DIV is EVEN then, Y equals $(\text{DCLK_DIV}/2) / (\text{DCLK_DIV}+1)$. For best performance, it is recommended to use a DCLK_DIV of 0 or ODD to minimize the duty cycle distortion. The HSDIVIDER on CLKOUTX2_H13 output of DPLL_PER can be used to achieve the desired clock divider ratio. All required details about clock division factor DCLK_DIV can be found in the device-specific Technical Reference Manual.

5.10.12 Data Modification Module (DMM)

A Data Modification Module (DMM) gives the ability to write external data into the device memory.

The DMM has the following features:

- Acts as a bus master, thus enabling direct writes to the 4GB address space without CPU intervention
- Writes to memory locations specified in the received packet (leverages packets defined by trace mode of the RAM trace port [RTP] module)
- Writes received data to consecutive addresses, which are specified by the DMM (leverages packets defined by direct data mode of RTP module)
- Configurable port width (1, 2, 4, 8, 16 pins)
- Up to 65 Mbit/s pin data rate

6 Detailed Description

6.1 Overview

The AWR1642 device includes the entire Millimeter Wave blocks and analog baseband signal chain for two transmitters and four receivers, as well as a customer-programmable MCU. This device is applicable as a radar-on-a-chip in use-cases with modest requirements for memory, processing capacity and application code size. These could be cost-sensitive automotive applications that are evolving from 24 GHz narrowband implementation and some emerging simple ultra-short-range radar applications. Typical application examples for this device include basic Blind Spot Detect, Parking Assist, and so forth.

In terms of scalability, the AWR1642 device could be paired with a low-end external MCU, to address more complex applications that might require additional memory for larger application software footprint and faster interfaces. Because the AWR1642 device also provides high speed data interfaces like Serial-LVDS, it is suitable for interfacing with more capable external processing blocks. Here system designers can choose the AWR1642 to provide raw ADC data.

6.3 Subsystems

6.3.1 RF and Analog Subsystem

The RF and analog subsystem includes the RF and analog circuitry – namely, the synthesizer, PA, LNA, mixer, IF, and ADC. This subsystem also includes the crystal oscillator and temperature sensors. The three transmit channels can be operated up to a maximum of two at a time (simultaneously) for transmit beamforming purpose as required; whereas the four receive channels can all be operated simultaneously.

6.3.1.1 Clock Subsystem

The AWR1642 clock subsystem generates 76 to 81 GHz from an input reference of 40-MHz crystal. It has a built-in oscillator circuit followed by a clean-up PLL and a RF synthesizer circuit. The output of the RF synthesizer is then processed by an X4 multiplier to create the required frequency in the 76 to 81 GHz spectrum. The RF synthesizer output is modulated by the timing engine block to create the required waveforms for effective sensor operation.

The clean-up PLL also provides a reference clock for the host processor after system wakeup.

The clock subsystem also has built-in mechanisms for detecting the presence of a crystal and monitoring the quality of the generated clock.

Figure 6-1 describes the clock subsystem.

Figure 6-1. Clock Subsystem

6.3.1.2 Transmit Subsystem

The AWR1642 transmit subsystem consists of two parallel transmit chains, each with independent binary phase and amplitude control. The device supports binary phase modulation for MIMO radar and interference mitigation.

Each transmit chain can deliver a maximum of 12 dBm at the antenna port on the PCB. The transmit chains also support programmable backoff for system optimization.

Figure 6-2 describes the transmit subsystem.

Figure 6-2. Transmit Subsystem (Per Channel)

6.3.1.3 Receive Subsystem

The AWR1642 receive subsystem consists of four parallel channels. A single receive channel consists of an LNA, mixer, IF filtering, A2D conversion, and decimation. All four receive channels can be operational at the same time an individual power-down option is also available for system optimization.

Unlike conventional real-only receivers, the AWR1642 device supports a complex baseband architecture, which uses quadrature mixer and dual IF and ADC chains to provide complex I and Q outputs for each receiver channel. The AWR1642 is targeted for fast chirp systems. The band-pass IF chain has configurable lower cutoff frequencies above 175 kHz and can support bandwidths up to 5 MHz.

Figure 6-3 describes the receive subsystem.

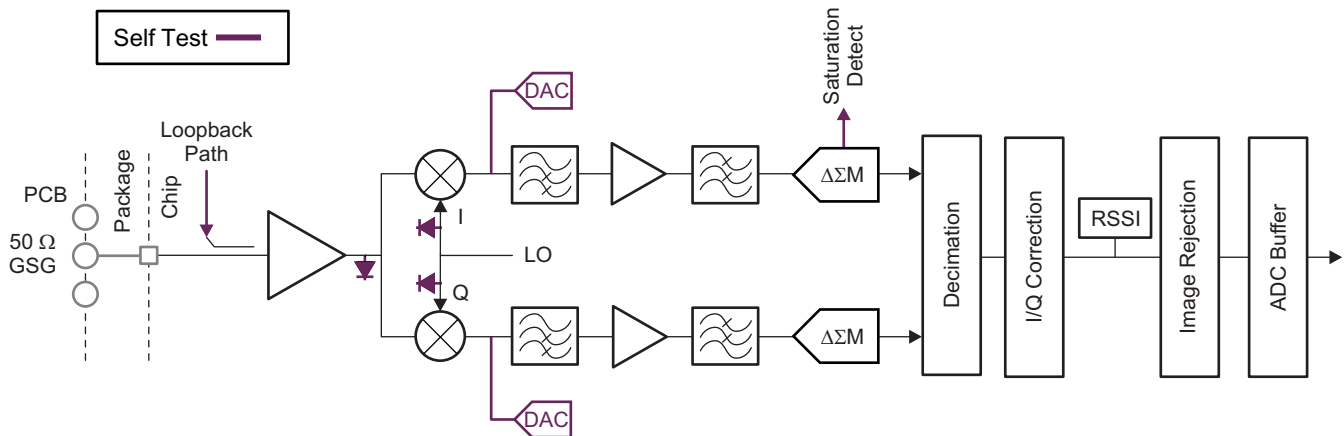

Figure 6-3. Receive Subsystem (Per Channel)

6.3.2 Processor Subsystem

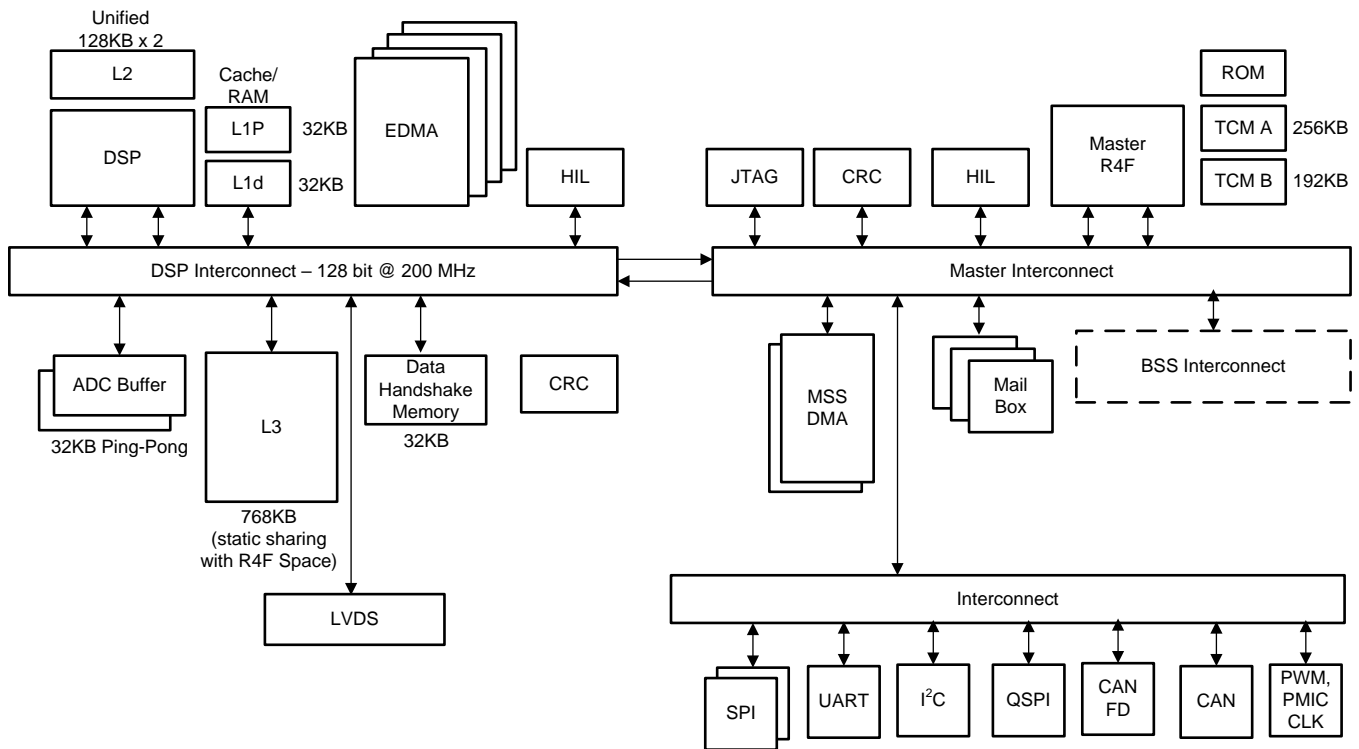

Figure 6-4. Processor Subsystem

Figure 6-4 shows the block diagram for customer programmable processor subsystems in the AWR1642 device. At a high level there are two customer programmable subsystems, as shown separated by a dotted line in the diagram. Left hand side shows the DSP Subsystem which contains TI's high-performance C674x DSP, a high-bandwidth interconnect for high performance (128-bit, 200MHz) and associated peripherals – four DMAs for data transfer, LVDS interface for Measurement data output, L3 Radar data cube memory, ADC buffers, CRC engine, and data handshake memory (additional memory provided on interconnect).

The right side of the diagram shows the Master subsystem. Master subsystem as name suggests is the master of the device and controls all the device peripherals and house-keeping activities of the device. Master subsystem contains Cortex-R4F (Master R4F) processor and associated peripherals and house-keeping components such as DMAs, CRC and Peripherals (I²C, UART, SPIs, CAN, PMIC clocking module, PWM, and others) connected to Master Interconnect through Peripheral Central Resource (PCR interconnect).

Details of the DSP CPU core can be found at <http://www.ti.com/product/TMS320C6748>.

HIL module is shown in both the subsystems and can be used to perform the radar operations feeding the captured data from outside into the device without involving the RF subsystem. HIL on master SS is for controlling the configuration and HIL on DSPSS for high speed ADC data input to the device. Both HIL modules uses the same IOs on the device, one additional IO (DMM_MUX_IN) allows selecting either of the two.

6.3.3 Automotive Interface

The AWR1642 communicates with the automotive network over the following main interfaces:

- CAN (2 interfaces available, one of them being CAN-FD)

6.3.4 Master Subsystem Cortex-R4F Memory Map

Table 6-1 shows the master subsystem, Cortex-R4F memory map.

NOTE

There are separate Cortex-R4F addresses and DMA MSS addresses for the master subsystem. See the [Technical Reference Manual](#) for a complete list.

6.4 Other Subsystems

6.4.1 ADC Channels (Service) for User Application

The AWR1642 device includes provision for an ADC service for user application, where the GPADC engine present inside the device can be used to measure up to six external voltages. The ADC1, ADC2, ADC3, ADC4, ADC5, and ADC6 pins are used for this purpose.

- ADC itself is controlled by TI firmware running inside the BIST subsystem and access to it for customer's external voltage monitoring purpose is via 'monitoring API' calls routed to the BIST subsystem. This API could be linked with the user application running on the Master R4.
- BIST subsystem firmware will internally schedule these measurements along with other ⁽¹⁾ RF and Analog monitoring operations. The API allows configuring the settling time (number of ADC samples to skip) and number of consecutive samples to take. At the end of a frame, the minimum, maximum and average of the readings will be reported for each of the monitored voltages.

GPADC Specifications:

- 625 Ksps SAR ADC
- 0 to 1.8V input range
- 10-bit resolution
- For 5 out of the 6 inputs, an optional internal buffer is available. Without the buffer, the ADC has a switched capacitor input load modeled with 5pF of sampling capacitance and 12pF parasitic capacitance (GPADC channel 6, the internal buffer is not available).

Figure 6-5. ADC Path

- (1) GPADC structures are used for measuring the output of internal temperature sensors. The accuracy of these measurements is $\pm 10^\circ\text{C}$

Table 6-3. GP-ADC Parameter

PARAMETER	TYP	UNIT
ADC supply	1.8	V
ADC unbuffered input voltage range	0 – 1.8	V
ADC buffered input voltage range ⁽¹⁾	0.4 – 1.3	V
ADC resolution	10	bits
ADC offset error	± 5	LSB

(1) Outside of given range, the buffer output will become nonlinear.

(2) ADC itself is controlled by TI firmware running inside the BIST subsystem. For more details please refer to the API calls.

7 Monitoring and Diagnostics

7.1 Monitoring and Diagnostic Mechanisms

Below is the list given for the main monitoring and diagnostic mechanisms available in the AWR1642.

Table 7-1. Monitoring and Diagnostic Mechanisms for AWR1642

S No	Feature	Description
1	Boot time LBIST For Master R4F Core and associated VIM	AWR1642 architecture supports hardware logic BIST (LBIST) engine self-test Controller (STC). This logic is used to provide a very high diagnostic coverage (>90%) on the Master R4F CPU core and Vectored Interrupt Module (VIM) at a transistor level. LBIST for the CPU and VIM need to be triggered by application code before starting the functional safety application. CPU stays there in while loop and does not proceed further if a fault is identified.
2	Boot time PBIST for Master R4F TCM Memories	Master R4F has three Tightly coupled Memories (TCM) memories TCMA, TCMB0 and TCMB1. AWR1642 architecture supports a hardware programmable memory BIST (PBIST) engine. This logic is used to provide a very high diagnostic coverage (March-13n) on the implemented Master R4F TCMs at a transistor level. PBIST for TCM memories is triggered by Bootloader at the boot time before starting download of application from Flash or peripheral interface. CPU stays there in while loop and does not proceed further if a fault is identified.
3	End to End ECC for Master R4F TCM Memories	TCMs diagnostic is supported by Single error correction double error detection (SECEDED) ECC diagnostic. An 8-bit code word is used to store the ECC data as calculated over the 64-bit data bus. ECC evaluation is done by the ECC control logic inside the CPU. This scheme provides end-to-end diagnostics on the transmissions between CPU and TCM. CPU can be configured to have predetermined response (Ignore or Abort generation) to single and double bit error conditions.
4	Master R4F TCM bit multiplexing	Logical TCM word and its associated ECC code is split and stored in two physical SRAM banks. This scheme provides an inherent diagnostic mechanism for address decode failures in the physical SRAM banks. Faults in the bank addressing are detected by the CPU as an ECC fault. Further, bit multiplexing scheme implemented such that the bits accessed to generate a logical (CPU) word are not physically adjacent. This scheme helps to reduce the probability of physical multi-bit faults resulting in logical multi-bit faults; rather they manifest as multiple single bit faults. As the SECEDED TCM ECC can correct a single bit fault in a logical word, this scheme improves the usefulness of the TCM ECC diagnostic. Both these features are hardware features and cannot be enabled or disabled by application software.
5	Clock Monitor	AWR1642 architecture supports Three Digital Clock Comparators (DCCs) and an internal RCOSC. Dual functionality is provided by these modules – Clock detection and Clock Monitoring. DCCint is used to check the availability/range of Reference clock at boot otherwise the device is moved into limp mode (Device still boots but on 10MHz RCOSC clock source. This provides debug capability). DCCint is only used by boot loader during boot time. It is disabled once the APLL is enabled and locked. DCC1 is dedicated for APLL lock detection monitoring, comparing the APLL output divided version with the Reference input clock of the device. Initially (before configuring APLL), DCC1 is used by bootloader to identify the precise frequency of reference input clock against the internal RCOSC clock source. Failure detection for DCC1 would cause the device to go into limp mode. DCC2 module is one which is available for user software. From the list of clock options given in detailed spec, any two clocks can be compared. One example usage is to compare the CPU clock with the Reference or internal RCOSC clock source. Failure detection is indicated to the Master R4F CPU via Error Signaling Module (ESM).
7	RTI/WD for Master R4F	AWR1642 architecture supports the use of an internal watchdog that is implemented in the real-time interrupt (RTI) module. The internal watchdog has two modes of operation: digital watchdog (DWD) and digital windowed watchdog (DWW). The modes of operation are mutually exclusive; the designer can elect to use one mode or the other but not both at the same time. Watchdog can issue either an internal (warm) system reset or a CPU non-mask able interrupt upon detection of a failure. The Watchdog is enabled by the bootloader in DWD mode at boot time to track the boot process. Once the application code takes up the control, Watchdog can be configured again for mode and timings based on specific customer requirements.

Table 7-1. Monitoring and Diagnostic Mechanisms for AWR1642 (continued)

S No	Feature	Description
8	MPU for Master R4F	Cortex-R4F CPU includes an MPU. The MPU logic can be used to provide spatial separation of software tasks in the device memory. Cortex-R4F MPU supports 12 regions. It is expected that the operating system controls the MPU and changes the MPU settings based on the needs of each task. A violation of a configured memory protection policy results in a CPU abort.
9	PBIST for Peripheral interface SRAMs - SPIs, CANs	AWR1642 architecture supports a hardware programmable memory BIST (PBIST) engine for Peripheral SRAMs as well. PBIST for peripheral SRAM memories can be triggered by the application. User can elect to run the PBIST on one SRAM or on groups of SRAMs based on the execution time, which can be allocated to the PBIST diagnostic. The PBIST tests are destructive to memory contents, and as such are typically run only at boot time. However, the user has the freedom to initiate the tests at any time if peripheral communication can be hindered. Any fault detected by the PBIST results in an error indicated in PBIST status registers.
10	ECC for Peripheral interface SRAMs – SPIs, CANs	Peripheral interface SRAMs diagnostic is supported by Single error correction double error detection (SECCDED) ECC diagnostic. When a single or double bit error is detected the Master R4F is notified via ESM (Error Signaling Module). This feature is disabled after reset. Software must configure and enable this feature in the peripheral and ESM module. ECC failure (both single bit corrected and double bit uncorrectable error conditions) is reported to the Master R4F as an interrupt via ESM module.
11	Configuration registers protection for Master SS peripherals	All the Master SS peripherals (SPIs, CANs, I2C, DMAs, RTI/WD, DCCs, IOMUX etc.) are connected to interconnect via Peripheral Central resource (PCR). This provides two diagnostic mechanisms that can limit access to peripherals. Peripherals can be clock gated per peripheral chip select in the PCR. This can be utilized to disable unused features such that they cannot interfere. In addition, each peripheral chip select can be programmed to limit access based on privilege level of transaction. This feature can be used to limit access to entire peripherals to privileged operating system code only. These diagnostic mechanisms are disabled after reset. Software must configure and enable these mechanisms. Protection violation also generates an 'aerror' that result in abort to Master R4F or error response to other masters such as DMAs.
12	Cyclic Redundancy Check –Master SS	AWR1642 architecture supports hardware CRC engine on Master SS implementing the below polynomials. <ul style="list-style-type: none"> • CRC16 CCITT – 0x10 • CRC32 Ethernet – 0x04C11DB7 • CRC64 • CRC 32C – CASTAGNOLI – 0x1EDC6F4 • CRC32P4 – E2E Profile4 – 0xF4ACFB1 • CRC-8 – H2F Autosar – 0x2F • CRC-8 – VDA CAN – 0x1D The read operation of the SRAM contents to the CRC can be done by CPU or by DMA. The comparison of results, indication of fault, and fault response are the responsibility of the software managing the test.
13	MPU for DMAs	AWR1642 architecture supports MPUs on Master SS DMAs. Failure detection by MPU is reported to the Master R4F CPU core as an interrupt via ESM. DSPSS's high performance EDMAs also includes MPUs on both read and writes master ports. EDMA MPUs supports 8 regions. Failure detection by MPU is reported to the DSP core as an interrupt via local ESM.
14	Boot time LBIST For BIST R4F Core and associated VIM	AWR1642 architecture supports hardware logic BIST (LBIST) even for BIST R4F core and associated VIM module. This logic provides very high diagnostic coverage (>90%) on the BIST R4F CPU core and VIM. This is triggered by Master R4F boot loader at boot time and it does not proceed further if the fault is detected.
15	Boot time PBIST for BIST R4F TCM Memories	AWR1642 architecture supports a hardware programmable memory BIST (PBIST) engine for BIST R4F TCMs which provide a very high diagnostic coverage (March-13n) on the BIST R4F TCMs. PBIST is triggered by Master R4F Bootloader at the boot time and it does not proceed further if the fault is detected.
16	End to End ECC for BIST R4F TCM Memories	BIST R4F TCMs diagnostic is supported by Single error correction double error detection (SECCDED) ECC diagnostic. Single bit error is communicated to the BIST R4FCPU while double bit error is communicated to Master R4F as an interrupt so that application code becomes aware of this and takes appropriate action.

Table 7-1. Monitoring and Diagnostic Mechanisms for AWR1642 (continued)

S No	Feature	Description
17	BIST R4F TCM bit multiplexing	Logical TCM word and its associated ECC code is split and stored in two physical SRAM banks. This scheme provides an inherent diagnostic mechanism for address decode failures in the physical SRAM banks and helps to reduce the probability of physical multi-bit faults resulting in logical multi-bit faults.
18	RTI/WD for BIST R4F	AWR1642 architecture supports an internal watchdog for BIST R4F. Timeout condition is reported via an interrupt to Master R4F and rest is left to application code to either go for SW reset for BIST SS or warm reset for the AWR1642 device to come out of faulty condition.
19	Boot time PBIST for L1P, L1D, L2 and L3 Memories	AWR1642 architecture supports a hardware programmable memory BIST (PBIST) engine for DSPSS's L1P, L1D, L2 and L3 memories which provide a very high diagnostic coverage (March-13n). PBIST is triggered by Master R4F Bootloader at the boot time and it does not proceed further if the fault is detected.
20	Parity on L1P	AWR1642 architecture supports Parity diagnostic on DSP's L1P memory. Parity error is reported to the CPU as an interrupt. Note:- L1D memory is not covered by parity or ECC and need to be covered by application level diagnostics.
21	ECC on DSP's L2 Memory	AWR1642 architecture supports both Parity Single error correction double error detection (SECDED) ECC diagnostic on DSP's L2 memory. L2 Memory is a unified 256KB of memory used to store program and Data sections for the DSP. A 12-bit code word is used to store the ECC data as calculated over the 256-bit data bus (logical instruction fetch size). The ECC logic for the L2 access is located in the DSP and evaluation is done by the ECC control logic inside the DSP. This scheme provides end-to-end diagnostics on the transmissions between DSP and L2. Byte aligned Parity mechanism is also available on L2 to take care of data section.
22	ECC on Radar Data Cube (L3) Memory	L3 memory is used as Radar data section in AWR1642. AWR1642 architecture supports Single error correction double error detection (SECDED) ECC diagnostic on L3 memory. An 8-bit code word is used to store the ECC data as calculated over the 64-bit data bus. Failure detection by ECC logic is reported to the Master R4F CPU core as an interrupt via ESM.
23	RTI/WD for DSP Core	AWR1642 architecture supports the use of an internal watchdog for BIST R4F that is implemented in the real-time interrupt (RTI) module – replication of same module as used in Master SS. This module supports same features as that of RTI/WD for Master/BIST R4F. This watchdog is enabled by customer application code and Timeout condition is reported via an interrupt to Master R4F and rest is left to application code in Master R4F to either go for SW reset for DSP SS or warm reset for the AWR1642 device to come out of faulty condition.
24	CRC for DSP Sub-System	AWR1642 architecture supports dedicated hardware CRC on DSPSS implementing the below polynomials. <ul style="list-style-type: none"> • CRC16 CCITT - 0x10 • CRC32 Ethernet - 0x04C11DB7 • CRC64 The read of SRAM contents to the CRC can be done by DSP CPU or by DMA. The comparison of results, indication of fault, and fault response are the responsibility of the software managing the test.
25	MPU for DSP	AWR1642 architecture supports MPUs for DSP memory accesses (L1D, L1P, and L2). L2 memory supports 64 regions and 16 regions for L1P and L1D each. Failure detection by MPU is reported to the DSP core as an abort.
26	Temperature Sensors	AWR1642 architecture supports various temperature sensors all across the device (next to power hungry modules such as PAs, DSP etc) which is monitored during the inter-frame period. ⁽¹⁾
27	Tx Power Monitors	AWR1642 architecture supports power detectors at the Tx output. ⁽²⁾

(1) Monitoring is done by the TI's code running on BIST R4F. There are two modes in which it could be configured to report the temperature sensed via API by customer application.

- Report the temperature sensed after every N frames
- Report the condition once the temperature crosses programmed threshold.

It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4F via Mailbox.

(2) Monitoring is done by the TI's code running on BIST R4F.

There are two modes in which it could be configured to report the detected output power via API by customer application.

- Report the power detected after every N frames
- Report the condition once the output power degrades by more than configured threshold from the configured.

It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4F.

Table 7-1. Monitoring and Diagnostic Mechanisms for AWR1642 (continued)

S No	Feature	Description
28	Error Signaling Error Output	When a diagnostic detects a fault, the error must be indicated. The AWR1642 architecture provides aggregation of fault indication from internal monitoring/diagnostic mechanisms using a peripheral logic known as the Error Signaling Module (ESM). The ESM provides mechanisms to classify errors by severity and to provide programmable error response. ESM module is configured by customer application code and specific error signals can be enabled or masked to generate an interrupt (Low/High priority) for the Master R4F CPU. AWR1642 supports Nerror output signal (IO) which can be monitored externally to identify any kind of high severity faults in the design which could not be handled by the R4F.
29	Synthesizer (Chirp) frequency monitor	Monitors Synthesizer's frequency ramp by counting (divided-down) clock cycles and comparing to ideal frequency ramp. Excess frequency errors above a certain threshold, if any, are detected and reported.
30	Ball break detection for TX ports (TX Ball break monitor)	AWR1642 architecture supports a ball break detection mechanism based on Impedance measurement at the TX output(s) to detect and report any large deviations that can indicate a ball break. Monitoring is done by TIs code running on BIST R4F and failure is reported to the Master R4F via Mailbox. It is completely up to customer SW to decide on the appropriate action based on the message from BIST R4F.
31	RX loopback test	Built-in TX to RX loopback to enable detection of failures in the RX path(s), including Gain/Noise figure, inter-RX balance, etc.
32	IF loopback test	Built-in IF (square wave) test tone input to monitor IF filter's frequency response and detect failure.
33	RX saturation detect	Provision to detect ADC saturation due to excessive incoming signal level and/or interference.
34	Boot time LBIST for DSP core	AWR1642 device supports boot time LBIST for the DSP Core. LBIST can be triggered by the Master R4F application code during boot time.

7.1.1 Error Signaling Module

When a diagnostic detects a fault, the error must be indicated. AWR1642 architecture provides aggregation of fault indication from internal diagnostic mechanisms using a peripheral logic known as the error signaling module (ESM). The ESM provides mechanisms to classify faults by severity and allows programmable error response. Below is the high level block diagram for ESM module.

8 Applications, Implementation, and Layout

NOTE

Information in the following Applications section is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

Key device features driving the following applications are:

- Integration of Radar Front End and Programmable MCU
- Flexible boot modes: Autonomous Application boot using a serial flash or external boot over SPI.

9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions follow.

9.1 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, *AWR1642*). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

X Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.

P Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.

null Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

TMDX Development-support product that has not yet completed Texas Instruments internal qualification testing.

TMDS Fully-qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, ABL0161), the temperature range (for example, blank is the default commercial temperature range). [Figure 9-1](#) provides a legend for reading the complete device name for any *AWR1642* device.

For orderable part numbers of *AWR1642* devices in the ABL0161 package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.

For additional description of the device nomenclature markings on the die, see the [AWR1642 Device Errata](#).

Models

AWR1642 BSDL Model Boundary scan database of testable input and output pins for IEEE 1149.1 of the specific device.

AWR1642 IBIS Model IO buffer information model for the IO buffers of the device. For simulation on a circuit board, see IBIS Open Forum.

AWR1642 Checklist for Schematic Review, Layout Review, Bringup/Wakeup A set of steps in spreadsheet form to select system functions and pinmux options. Specific EVM schematic and layout notes to apply to customer engineering. A bringup checklist is suggested for customers.

9.3 Documentation Support

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on ti.com (AWR1642). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

The current documentation that describes the DSP, related peripherals, and other technical collateral follows.

Errata

9.6 静电放电警告

ESD 可能会损坏该集成电路。德州仪器 (TI) 建议通过适当的预防措施处理所有集成电路。如果不遵守正确的处理措施和安装程序，可能会损坏集成电路。

ESD 的损坏小至导致微小的性能降级，大至整个器件故障。精密的集成电路可能更容易受到损坏，这是因为非常细微的参数更改都可能会导致器件与其发布的规格不相符。

9.7 出口管制提示

接收方同意：如果美国或其他适用法律限制或禁止将通过非披露义务的披露方获得的任何产品或技术数据（其中包括软件）（见美国、欧盟和其他出口管理条例之定义）、或者其他适用国家条例限制的任何受管制产品或此项技术的任何直接产品出口或再出口至任何目的地，那么在没有事先获得美国商务部和其他相关政府机构授权的情况下，接收方不得在知情的情况下，以直接或间接的方式将其出口。

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
