TEXAS INSTRUMENTS

DRV8302 具有双路分流放大器和降压稳压器的三相栅极驱动器 – 硬件控制

1 特性

- 8V 至 60V 运行电源电压范围
- 栅极可驱动 1.7A 拉电流和 2.3A 灌电流
- 支持 100% 占空比的自举栅极驱动器
- 6 种或 3 种脉宽调制 (PWM) 输入模式
- 两个增益和偏移可调节的集成分流放大器
- 支持 3.3V 和 5V 接口
- 硬件控制接口
- 保护 特性：
  - 可编程死区控制 (DTC)
  - 可编程过流保护 (OCP)
  - PVDD 和 GVDD 欠压锁定 (UVLO)
  - GVDD 过压锁定 (OVLO)
  - 过热警告/关断 (OTW/OTS)
  - 通过 nFAULT 和 nOCTW 引脚报告

2 应用范围

- 三相无刷直流 (BLDC) 电机和永磁同步电机 (PMSM)
- 持续正压通气 (CPAP) 和泵
- 电动自行车
- 电动工具
- 机器人和遥控 (RC) 玩具
- 工业自动化

3 说明

DRV8302 是一款适用于三相电机驱动应用的栅极驱动器集成 电路 (IC)。它提供三个半桥驱动器，每个半桥驱动器可驱动两个 N 沟道金属氧化物半导体场效应晶体管 (MOSFET)。该器件最高支持 1.7A 拉电流和 2.3A 峰值电流。DRV8302 可通过具有 8V 至 60V 宽工作电压范围的单一电源供电。它采用自举栅极驱动器架构和涓流充电电路来支持 100% 占空比。DRV8302 在切换高侧或低侧 MOSFET 时使用自动握手机制，以防止发生电流击穿。高侧和低侧 MOSFET 的集成 VDS 感测用于防止外部功率级出现过流现象。

DRV8303 具备两个对电流进行精确测量的分流放大器。这两个放大器支持双向电流感测，最高可提供 3V 可调节输出偏移。

DRV8302 还包括输出和开关频率可调节的集成开关模式降压转换器。该降压转换器最高可提供 1.5A 的电流，以满足 MCU 或其他系统的功率需求。

凭借硬件接口可配置不同器件参数，包括死区、过流、PWM 模式和放大器设置。错误条件通过 nFAULT 和 nOCTW 引脚报告。

器件信息[1]

器件型号	封装	封装尺寸（标称值）
DRV8302	带散热片薄型小外形尺寸封装 (HTSSOP) (56)	14.00mm x 6.10mm

(1) 要了解所有可用封装，请见数据表末尾的可订购产品附录。

简化电路原理图

目录

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision B (February 2016) to Revision C   **Page**

- 已删除 REG 0x02 from the test conditions of the I_{oso1} and I_{osi1} parameters in the *Electrical Characteristics* table 7
- 已更改 the value of R1 + R2 ≥ 100 KΩ to R1 + R2 ≥ 1 KΩ in the *OC_ADJ* section... 17

Changes from Revision A (December 2015) to Revision B   **Page**

- Changed VEN_BUCK in *Buck Converter Characteristics* From: MIN = 0.9 V and MAX = 1.55 V To: MIN = 1.11 V and MAX = 1.36 V. 9

Changes from Original (August 2011) to Revision A   **Page**

- 已添加 引脚配置和功能部分，*ESD* 额定值表，特性 描述 部分，器件功能模式，应用和实施部分，电源相关建议部分，布局部分，器件和文档支持部分以及机械、封装和可订购信息部分 1
- V_{PVDD} absolute max voltage rating reduced from 70 V to 65 V 5
- Clarification made on how the OCP status bits report in *Overcurrent Protection (OCP) and Reporting* 16
- Update to PVDD1 undervoltage protection in *Undervoltage Protection (UVLO)* describing specific transient brownout issue. 17
- Update to EN_GATE pin functional description in *EN_GATE* clarifying proper EN_GATE reset pulse lengths. 19
- Added gate driver power-up sequencing errata *Gate Driver Power Up Sequencing Errdata*.. 20
- Added *Community Resources* 24

GND (57) - PowerPAD

Pin Functions

PIN		I/O[1]	DESCRIPTION
NO.	NAME		
1	RT_CLK	I	Resistor timing and external clock for buck regulator. Resistor should connect to GND (PowerPAD™) with very short trace to reduce the potential clock jitter due to noise.
2	COMP	O	Buck error amplifier output and input to the output switch current comparator.
3	VSENSE	I	Buck output voltage sense pin. Inverting node of error amplifier.
4	PWRGD	I	An open drain output with external pullup resistor required. Asserts low if buck output voltage is low due to thermal shutdown, dropout, overvoltage, or EN_BUCK shut down
5	nOCTW	O	Overcurrent and overtemperature warning indicator. This output is open drain with external pullup resistor required.
6	nFAULT	O	Fault report indicator. This output is open drain with external pullup resistor required.
7	DTC	I	Dead-time adjustment with external resistor to GND
8	M_PWM	I	Mode selection pin for PWM input configuration. If M_PWM = LOW, the device supports 6 independent PWM inputs. When M_PWM = HIGH, the device must be connected to ONLY 3 PWM input signals on INH_x. The complementary PWM signals for low side signaling will be internally generated from the high side inputs.
9	M_OC	I	Mode selection pin for over-current protection options. If M_OC = LOW, the gate driver will operate in a cycle-by-cycle current limiting mode. If M_OC = HIGH, the gate driver will shutdown the channel which detected an over-current event.
10	GAIN	O	Gain selection for integrated current shunt amplifiers. If GAIN = LOW, the internal current shunt amplifiers have a gain of 10V/V. If GAIN = HIGH, the current shunt amplifiers have a gain of 40V/V.
11	OC_ADJ	I	Overcurrent trip set pin. Apply a voltage on this pin to set the trip point for the internal overcurrent protection circuitry. A voltage divider from DVDD is recommended.
12	DC_CAL	I	When DC_CAL is high, device shorts inputs of shunt amplifiers and disconnects loads. DC offset calibration can be done through external microcontroller.

(1)　KEY: I =Input, O = Output, P = Power

Pin Functions (continued)

PIN		I/O[(1)]	DESCRIPTION
NO.	NAME		
13	GVDD	P	Internal gate driver voltage regulator. GVDD cap should connect to GND
14	CP1	P	Charge pump pin 1, ceramic cap should be used between CP1 and CP2
15	CP2	P	Charge pump pin 2, ceramic cap should be used between CP1 and CP2
16	EN_GATE	I	Enable gate driver and current shunt amplifiers. Control buck via EN_BUCK pin.
17	INH_A	I	PWM Input signal (high side), half-bridge A
18	INL_A	I	PWM Input signal (low side), half-bridge A
19	INH_B	I	PWM Input signal (high side), half-bridge B
20	INL_B	I	PWM Input signal (low side), half-bridge B
21	INH_C	I	PWM Input signal (high side), half-bridge C
22	INL_C	I	PWM Input signal (low side), half-bridge C
23	DVDD	P	Internal 3.3-V supply voltage. DVDD cap should connect to AGND. This is an output, but not specified to drive external circuitry.
24	REF	I	Reference voltage to set output of shunt amplfiiers with a bias voltage which equals to half of the voltage set on this pin. Connect to ADC reference in microcontroller.
25	SO1	O	Output of current amplifier 1
26	SO2	O	Output of current amplifier 2
27	AVDD	P	Internal 6-V supply voltage, AVDD cap should connect to AGND. This is an output, but not specified to drive external circuitry.
28	AGND	P	Analog ground pin
29	PVDD1	P	Power supply pin for gate driver and current shunt amplifier. PVDD1 is independent of buck power supply, PVDD2. PVDD1 cap should connect to GND
30	SP2	I	Input of current amplifier 2 (connecting to positive input of amplifier). Recommend to connect to ground side of the sense resistor for the best commom mode rejection.
31	SN2	I	Input of current amplifier 2 (connecting to negative input of amplifier).
32	SP1	I	Input of current amplifier 1 (connecting to positive input of amplifier). Recommend to connect to ground side of the sense resistor for the best commom mode rejection.
33	SN1	I	Input of current amplifier 1 (connecting to negative input of amplifier).
34	SL_C	I	Low-Side MOSFET source connection, half-bridge C. Low-side V_{DS} measured between this pin and SH_C.
35	GL_C	O	Gate drive output for Low-Side MOSFET, half-bridge C
36	SH_C	I	High-Side MOSFET source connection, half-bridge C. High-side V_{DS} measured between this pin and PVDD1.
37	GH_C	O	Gate drive output for High-Side MOSFET, half-bridge C
38	BST_C	P	Bootstrap cap pin for half-bridge C
39	SL_B	I	Low-Side MOSFET source connection, half-bridge B. Low-side V_{DS} measured between this pin and SH_B.
40	GL_B	O	Gate drive output for Low-Side MOSFET, half-bridge B
41	SH_B	I	High-Side MOSFET source connection, half-bridge B. High-side V_{DS} measured between this pin and PVDD1.
42	GH_B	O	Gate drive output for High-Side MOSFET, half-bridge B
43	BST_B	P	Bootstrap cap pin for half-bridge B
44	SL_A	I	Low-Side MOSFET source connection, half-bridge A. Low-side V_{DS} measured between this pin and SH_A.
45	GL_A	O	Gate drive output for Low-Side MOSFET, half-bridge A
46	SH_A	I	High-Side MOSFET source connection, half-bridge A. High-side V_{DS} measured between this pin and PVDD1.
47	GH_A	O	Gate drive output for High-Side MOSFET, half-bridge A
48	BST_A	P	Bootstrap cap pin for half-bridge A
49	BIAS	I	Bias pin. Connect 1M-Ω resistor to GND, or 0.1 µF capacitor to GND.
50, 51	PH	O	The source of the internal high side MOSFET of buck converter

Pin Functions (continued)

PIN		I/O[1]	DESCRIPTION
NO.	NAME		
52	BST_BK	P	Bootstrap cap pin for buck converter
53, 54	PVDD2	P	Power supply pin for buck converter, PVDD2 cap should connect to GND.
55	EN_BUCK	I	Enable buck converter. Internal pullup current source. Pull below 1.2 V to disable. Float to enable. Adjust the input undervoltage lockout with two resistors
56	SS_TR	I	Buck soft-start and tracking. An external capacitor connected to this pin sets the output rise time. Since the voltage on this pin overrides the internal reference, it can be used for tracking and sequencing. Cap should connect to GND
57	GND (PWR_PAD)	P	GND pin. The exposed power pad must be electrically connected to ground plane through soldering to PCB for proper operation and connected to bottom side of PCB through vias for better thermal spreading.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)[1]

			MIN	MAX	UNIT
V_{PVDD}	Supply voltage	Relative to PGND	−0.3	65	V
$PVDD_{RAMP}$	Maximum supply voltage ramp rate	Voltage rising up to $PVDD_{MAX}$		1	V/μs
V_{PGND}	Maximum voltage between PGND and GND		−0.3	0.3	V
I_{IN_MAX}	Maximum current, all digital and analog input pins except nFAULT and nOCTW pins		−1	1	mA
$I_{IN\_OD\_MAX}$	Maximum sinking current for open-drain pins (nFAULT and nOCTW Pins)			7	mA
V_{OPA_IN}	Voltage range for SPx and SNx pins		−0.6	0.6	V
V_{LOGIC}	Input voltage range for logic/digital pins (INH_A, INL_A, INH_B, INL_B, INH_C, INL_C, EN_GATE, M_PWM, M_OC, OC_ADJ, GAIN, DC_CAL)		−0.3	7	V
V_{GVDD}	Maximum voltage for GVDD pin			13.2	V
V_{AVDD}	Maximum voltage for AVDD pin			8	V
V_{DVDD}	Maximum voltage for DVDD pin			3.6	V
V_{REF}	Maximum reference voltage for current amplifier			7	V
I_{REF}	Maximum current for REF Pin			100	μA
T_J	Maximum operating junction temperature		−40	150	°C
T_{stg}	Storage temperature		−55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001[1]	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101[2]	±500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

			MIN	NOM	MAX	UNIT
V_{PVDD}	DC supply voltage PVDD1 for normal operation	Relative to PGND	8		60	V
	DC supply voltage PVDD2 for buck converter		3.5		60	V
I_{DIN_EN}	Input current of digital pins when EN_GATE is high				100	µA
I_{DIN_DIS}	Input current of digital pins when EN_GATE is low				1	µA
C_{O_OPA}	Maximum output capacitance on outputs of shunt amplifier				20	pF
R_{DTC}	Dead time control resistor range. Time range is 50 ns (–GND) to 500 ns (150 kΩ) with a linear approximation.		0		150	kΩ
I_{FAULT}	$\overline{FAULT}$ pin sink current. Open drain	V = 0.4 V			2	mA
I_{OCTW}	$\overline{OCTW}$ pin sink current. Open drain	V = 0.4 V			2	mA
V_{REF}	External voltage reference voltage for current shunt amplifiers		2		6	V
f_{gate}	Operating switching frequency of gate driver	Qg(TOT) = 25 nC or total 30-mA gate drive average current			200	kHz
T_A	Ambient temperature		–40		125	°C

6.4 Thermal Information

THERMAL METRIC[1]		DRV8302	UNIT
		DCA (HTSSOP)	
		56 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	30.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	33.5	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	17.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.9	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	7.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	0.9	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report (SPRA953).

6.5 Electrical Characteristics

PVDD = 8 V to 60 V, T_C = 25°C, unless specified under test condition

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT PINS: INH_X, INL_X, M_PWM, M_OC, GAIN, EN_GATE, DC_CAL						
V_{IH}	High input threshold		2			V
V_{IL}	Low input threshold				0.8	V
R_{EN_GATE}	Internal pulldown resistor for EN_GATE			100		kΩ
R_{INH_X}	Internal pulldown resistor for high side PWMs (INH_A, INH_B, and INH_C)	EN_GATE high		100		kΩ
R_{INH_X}	Internal pulldown resistor for low side PWMs (INL_A, INL_B, and INL_C)	EN_GATE high		100		kΩ
R_{M_PWM}	Internal pulldown resistor for M_PWM	EN_GATE high		100		kΩ
R_{M_OC}	Internal pulldown resistor for M_OC	EN_GATE high		100		kΩ
R_{DC_CAL}	Internal pulldown resistor for DC_CAL	EN_GATE high		100		kΩ
OUTPUT PINS: nFAULT AND nOCTW						
V_{OL}	Low output threshold	I_O = 2 mA			0.4	V
V_{OH}	High output threshold	External 47-kΩ pullup resistor connected to 3-5.5 V	2.4			V
I_{OH}	Leakage current on open-drain pins When logic high (nFAULT and nOCTW)				1	µA
GATE DRIVE OUTPUT: GH_A, GH_B, GH_C, GL_A, GL_B, GL_C						
V_{GX_NORM}	Gate driver Vgs voltage	PVDD = 8 V to 60 V	9.5		11.5	V
I_{oso1}	Maximum source current setting 1, peak	Vgs of FET equals to 2 V		1.7		A
I_{osi1}	Maximum sink current setting 1, peak	Vgs of FET equals to 8 V		2.3		A
R_{gate_off}	Gate output impedance during standby mode when EN_GATE low (pins GH_x, GL_x)		1.6		2.4	kΩ
SUPPLY CURRENTS						
I_{PVDD1_STB}	PVDD1 supply current, standby	EN_GATE is low. PVDD1 = 8 V.		20	50	µA
I_{PVDD1_OP}	PVDD1 supply current, operating	EN_GATE is high, no load on gate drive output, switching at 10 kHz, 100-nC gate charge		15		mA
I_{PVDD1_HIZ}	PVDD1 Supply current, HiZ	EN_GATE is high, gate not switching	2	5	11	mA
INTERNAL REGULATOR VOLTAGE						
A_{VDD}	AVDD voltage		6	6.5	7	V
D_{VDD}	DVDD voltage		3	3.3	3.6	V
VOLTAGE PROTECTION						
V_{PVDD_UV}	Undervoltage protection limit, PVDD				6	V
V_{GVDD_UV}	Undervoltage protection limit, GVDD				8	V
V_{GVDD_OV}	Overvoltage protection limit, GVDD			16		V
CURRENT PROTECTION, (VDS SENSING)						
V_{DS_OC}	Drain-source voltage protection limit		0.125		2.4	V
T_{oc}	OC sensing response time			1.5		µs
T_{OC_PULSE}	$\overline{OCTW}$ pin reporting pulse stretch length for OC event			64		µs

6.6 Gate Timing and Protection Characteristics

			MIN	NOM	MAX	UNIT
TIMING, OUTPUT PINS						
$t_{pd,lf\text{-}O}$	Positive input falling to GH_x falling	CL=1 nF, 50% to 50%			45	ns
$t_{pd,lr\text{-}O}$	Positive input rising to GL_x falling	CL=1 nF, 50% to 50%			45	ns
T_{d_min}	Minimum dead time after hand shaking[1]				50	ns
T_{dtp}	Dead Time	With R_{DTC} set to different values	50		500	ns
t_{GDr}	Rise time, gate drive output	CL=1 nF, 10% to 90%			25	ns
t_{GDF}	Fall time, gate drive output	CL=1 nF, 90% to 10%			25	ns
T_{ON_MIN}	Minimum on pulse	Not including handshake communication. Hiz to on state, output of gate driver			50	ns
T_{pd_match}	Propagation delay matching between high side and low side				5	ns
T_{dt_match}	Deadtime matching				5	ns
TIMING, PROTECTION AND CONTROL						
$t_{pd,R\_GATE\text{-}OP}$	Start-up time, from EN_GATE active high to device ready for normal operation	PVDD is up before start-up, all charge pump caps and regulator caps as in recommended condition	5		10	ms
$t_{pd,R\_GATE\text{-}Quick}$	If EN_GATE goes from high to low and back to high state within quick reset time, it will only reset all faults and gate driver without powering down charge pump, current amp, and related internal voltage regulators.	Maximum low pulse time			10	us
$t_{pd,E\text{-}L}$	Delay, error event to all gates low				200	ns
$t_{pd,E\text{-}FAULT}$	Delay, error event to $\overline{FAULT}$ low				200	ns
OTW_CLR	Junction temperature for resetting overtemperature warning				115	°C
OTW_SET/OTSD_CLR	Junction temperature for overtemperature warning and resetting overtemperature shut down				130	°C
OTSD_SET	Junction temperature for overtemperature shut down				150	°C

(1) Dead time programming definition: Adjustable delay from GH_x falling edge to GL_X rising edge, and GL_X falling edge to GH_X rising edge. This is a minimum dead-time insertion. It is not added to the value set by the microcontroller externally.

6.7 Current Shunt Amplifier Characteristics

T_C = 25°C unless otherwise specified

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
G1	Gain option 1	(GAIN = 0 V)	9.5	10	10.5	V/V
G2	Gain option 2	(GAIN = 2 V)	38	40	42	V/V
Tsettling	Settling time to 1%	Tc = 0°C to 60°C, G = 10, Vstep = 2 V		300		ns
Tsettling	Settling time to 1%	Tc = 0°C to 60°C, G = 40, Vstep = 2 V		1.2		µs
Vswing	Output swing linear range		0.3		5.7	V
Slew Rate		G = 10		10		V/µs
DC_offset	Offset error RTI	G = 10 with input shorted			4	mV
Drift_offset	Offset drift RTI			10		µV/C
Ibias	Input bias current				100	µA
Vin_com	Common input mode range		−0.15		0.15	V
Vin_dif	Differential input range		−0.3		0.3	V
Vo_bias	Output bias	With zero input current, Vref up to 6 V	−0.5%	0.5×Vref	0.5%	V
CMRR_OV	Overall CMRR with gain resistor mismatch	CMRR at DC, gain = 10	70	85		dB

6.8 Buck Converter Characteristics

T_C = 25°C unless otherwise specified

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{UVLO}	Internal undervoltage lockout threshold	No voltage hysteresis, rising and falling		2.5		V
$I_{SD(PVDD2)}$	Shutdown supply current	EN = 0 V, 25°C, 3.5 V ≤ VIN ≤ 60 V		1.3	4	µA
$I_{NON\_SW(PVDD2)}$	Operating: nonswitching supply current	VSENSE = 0.83 V, VIN = 12 V		116	136	µA
V_{EN_BUCK}	Enable threshold voltage	No voltage hysteresis, rising and falling	1.11	1.25	1.36	V
R_{DS_ON}	On-resistance	VIN = 12 V, BOOT-PH = 6 V		200	410	mΩ
I_{LIM}	Current limit threshold	VIN = 12 V, T_J = 25°C	1.8	2.7		A
OTSD_BK	Thermal shutdown			150		°C
F_{sw}	Switching frequency	RT = 200 kΩ	450	581	720	kHz
PWRGD	VSENSE threshold	VSENSE falling		92%		
		VSENSE rising		94%		
		VSENSE rising		109%		
		VSENSE falling		107%		
	Hysteresis	VSENSE falling		2%		
	Output high leakage	VSENSE = VREF, V(PWRGD) = 5.5 V, 25°C		10		nA
	On resistance	I(PWRGD) = 3 mA, VSENSE < 0.79 V		50		Ω

7 Detailed Description

7.1 Overview

The DRV8302 is a 8-V to 60-V, gate driver IC for three phase motor drive applications. This device reduces external component count by integrating three half-bridge drivers, two current shunt amplifiers, and a switching buck converter. The DRV8302 provides overcurrent, overtemperature, and undervoltage protection. Fault conditions are indicated through the nFAULT and nOCTW pins.

Adjustable dead time control allows for finely tuning the switching of the external MOSFETs. Internal hand shaking is used to prevent shoot-through current. VDS sensing of the external MOSFETs allows for the DRV8302 to detect overcurrent conditions and respond appropriately. The VDS trip point can be set through a hardware pin.

The highly configurable buck converter can support a wide range of output options. This allows the DRV8302 to provide a power supply rail for the controller and lower voltage components.

7.2 Function Block Diagram

7.3 Feature Description

7.3.1 Three-Phase Gate Driver

The half-bridge drivers use a bootstrap configuration with a trickle charge pump to support 100% duty cycle operation. Each half-bridge is configured to drive two N-channel MOSFETs, one for the high-side and one for the low-side. The half-bridge drivers can be used in combination to drive a 3-phase motor or separately to drive various other loads.

The internal dead times are adjustable to accommodate a variety of external MOSFETs and applications. The dead time is adjusted with an external resistor on the DTC pin. Shorting the DTC pin to ground provides the minimum dead time (50 ns). There is an internal hand shake between the high side and low side MOSFETs during switching transitions to prevent current shoot-through.

The three-phase gate driver can provide up to 30 mA of average gate driver current. This can support switching frequencies up to 200 kHz when the MOSFET Qg = 25 nC. The high side gate drive will survive negative output from the half-bridge up to –10 V for 10 ns. During EN_GATE low and fault conditions the gate driver keeps the external MOSFETs in high impedance mode.

Each MOSFET gate driver has a V_{DS} sensing circuit for overcurrent protection. The sense circuit measures the voltage from the drain to the source of the external MOSFETs while the MOSFET is enabled. This voltage is compared against the programmed trip point to determine if an overcurrent event has occurred. The trip voltage is set through the OC_ADJ pin with a voltage usually set with a resistor divider. The high-side sense is between the PVDD1 and SH_X pins. The low-side sense is between the SH_X and SL_X pins. Ensuring a differential, low impedance connection to the external MOSFETs for these lines helps provide accurate VDS sensing. The DRV8302 provides both cycle-by-cycle current limiting and latch overcurrent shutdown of the external MOSFET through the M_OC pin.

The DRV8302 allows for both 6-PWM and 3-PWM control through the M_PWM pin.

表 1. 6-PWM Mode

7.3.2 Current Shunt Amplifiers

The DRV8302 includes two high performance current shunt amplifiers to accurate low-side, inline current measurement.

The current shunt amplifiers have 2 programmable GAIN settings through the GAIN pin. These are 10, and 40 V/V.

They provide output offset up to 3 V to support bidirectional current sensing. The offset is set to half the voltage on the reference pin (REF).

To minimize DC offset and drift overtemperature, a calibration method is provided through either the DC_CAL pin. When DC calibration is enabled, the device shorts the input of the current shunt amplifier and disconnect the load. DC calibration can be done at any time, even during MOSFET switching, since the load is disconnected. For the best results, perform the DC calibration during the switching OFF period, when no load is present, to reduce the potential noise impact to the amplifier.

The output of current shunt amplifier can be calculated as:

$$V_O = \frac{V_{REF}}{2} - G \times (SN_X - SP_X)$$

where

- VREF is the reference voltage (REF pin)
- G is the gain of the amplifier (10 or 40 V/V)
- SNX and SPx are the inputs of channel x   (1)

SPx should connect to resistor ground for the best common mode rejection.

图 4 shows current amplifier simplified block diagram.
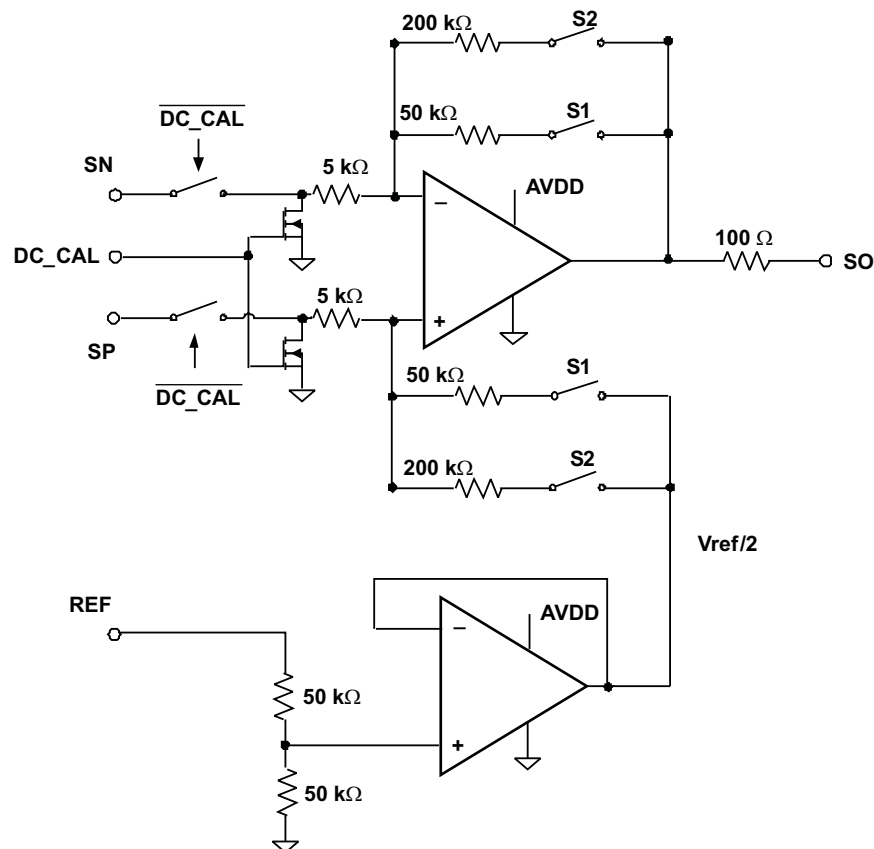

图 4. Current Shunt Amplifier Simplified Block Diagram

7.3.3 Buck Converter

The DRV8302 uses an integrated TPS54160 1.5-A, 60-V, step-down DC-DC converter. Although integrated in the same device, the buck converter is designed completely independent of the rest of the gate driver circuitry. Because the buck converter can support external MCU or other external power need, the independency of buck operation is crucial for a reliable system; this gives the buck converter minimum impact from gate driver operations. Some examples are: when gate driver shuts down due to any failure, the buck still operates unless the fault is coming from the buck itself. The buck keeps operating at much lower PVDD of 3.5 V, assuring the system has a smooth power-up and power-down sequence when gate driver is not able to operate due to a low PVDD.

For proper selection of the buck converter external components, see the data sheet, *TPS54160 1.5-A, 60-V, Step-Down DC/DC Converter With Eco-mode™*, SLVSB56.

The buck has an integrated high-side N-channel MOSFET. To improve performance during line and load transients the device implements a constant frequency, current mode control which reduces output capacitance and simplifies external frequency compensation design.

The wide switching frequency of 300 kHz to 2200 kHz allows for efficiency and size optimization when selecting the output filter components. The switching frequency is adjusted using a resistor to ground on the RT_CLK pin. The device has an internal phase lock loop (PLL) on the RT_CLK pin that is used to synchronize the power switch turn on to a falling edge of an external system clock.

The buck converter has a default start-up voltage of approximately 2.5 V. The EN_BUCK pin has an internal pullup current source that can be used to adjust the input voltage undervoltage lockout (UVLO) threshold with two external resistors. In addition, the pullup current provides a default condition. When the EN_BUCK pin is floating the device will operate. The operating current is 116 µA when not switching and under no load. When the device is disabled, the supply current is 1.3 µA.

The integrated 200-mΩ high-side MOSFET allows for high-efficiency power supply designs capable of delivering 1.5 A of continuous current to a load. The bias voltage for the integrated high side MOSFET is supplied by a capacitor on the BOOT to PH pin. The boot capacitor voltage is monitored by an UVLO circuit that turns the high side MOSFET off when the boot voltage falls below a preset threshold. The buck can operate at high duty cycles because of the boot UVLO. The output voltage can be stepped down to as low as the 0.8-V reference.

The BUCK has a power good comparator (PWRGD) which asserts when the regulated output voltage is less than 92% or greater than 109% of the nominal output voltage. The PWRGD pin is an open-drain output that deasserts when the VSENSE pin voltage is between 94% and 107% of the nominal output voltage, allowing the pin to transition high when a pullup resistor is used.

The BUCK minimizes excessive output overvoltage (OV) transients by taking advantage of the OV power good comparator. When the OV comparator is activated, the high-side MOSFET is turned off and masked from turning on until the output voltage is lower than 107%.

The SS_TR (slow start/tracking) pin is used to minimize inrush currents or provide power supply sequencing during power-up. A small value capacitor should be coupled to the pin to adjust the slow start time. A resistor divider can be coupled to the pin for critical power supply sequencing requirements. The SS_TR pin is discharged before the output powers up. This discharging ensures a repeatable restart after an overtemperature fault,

The BUCK, also, discharges the slow-start capacitor during overload conditions with an overload recovery circuit. The overload recovery circuit slow-starts the output from the fault voltage to the nominal regulation voltage once a fault condition is removed. A frequency foldback circuit reduces the switching frequency during start-up and overcurrent fault conditions to help control the inductor current.

7.3.4 Protection Features

The DRV8302 provides a broad range of protection features and fault condition reporting. The DRV8302 has undervoltage and overtemperature protection for the IC. It also has overcurrent and undervoltage protection for the MOSFET power stage. In fault shut down conditions all gate driver outputs is held low to ensure the external MOSFETs are in a high impedance state.

7.3.4.1 Overcurrent Protection (OCP) and Reporting

To protect the power stage from damage due to excessive currents, V_{DS} sensing circuitry is implemented in the DRV8302. Based on the $R_{DS(on)}$ of the external MOSFETs and the maximum allowed I_{DS}, a voltage threshold can be determined to trigger the overcurrent protection features when exceeded. The voltage threshold is programmed through the OC_ADJ pin by applying an external reference voltage with a DAC or resistor divider from DVDD. Overcurrent protection should be used as a protection scheme only; it is not intended as a precise current regulation scheme. There can be up to a 20% tolerance across channels for the V_{DS} trip point.

$$V_{DS} = I_{DS} \times R_{DS(on)}$$

(2)

The V_{DS} sense circuit measures the voltage from the drain to the source of the external MOSFET while the MOSFET is enabled. The high-side sense is between the PVDD and SH_X pins. The low-side sense is between the SH_X and SL_X pins. Ensuring a differential, low impedance connection to the external MOSFETs for these lines helps provide accurate V_{DS} sensing.

There are two different overcurrent modes that can be set through the M_OC pin.

7.3.4.1.1 Current Limit Mode (M_OC = LOW)

In current limit mode the devices uses current limiting instead of device shutdown during an overcurrent event. After the overcurrent event, the MOSFET in which the overcurrent was detected in will shut off until the next PWM cycle. The overcurrent event will be reported through the nOCTW pin. The nOCTW pin will be held low for a maximum 64 µs period (internal timer) or until the next PWM cycle. If another overcurrent event is triggered from another MOSFET, during a previous overcurrent event, the reporting will continue for another 64 µs period (internal timer will restart) or until both PWM signals cycle.

In current limit mode the device uses current limiting instead of device shutdown during an overcurrent event. In this mode the device reports overcurrent events through the nOCTW pin. The nOCTW pin will be held low for a maximum 64 µs period (internal timer) or until the next PWM cycle. If another overcurrent event is triggered from another MOSFET, during a previous overcurrent event, the reporting will continue for another 64 µs period (internal timer will restart) or until both PWM signals cycle.

7.3.4.1.2 OC Latch Shutdown Mode

When an overcurrent event occurs, both the high-side and low-side MOSFETs will be disabled in the corresponding half-bridge. The nFAULT pin will latch until the fault is reset through a quick EN_GATE reset pulse.

7.3.4.2 OC_ADJ

When external MOSFET is turned on, the output current flows through the on resistance, $R_{DS(on)}$ of the MOSFET, which creates a voltage drop V_{DS}. The over current protection event will be enabled when the V_{DS} exceeds a pre-set value. The voltage on OC_ADJ pin will be used to pre-set the OC tripped value. The OC tripped value I_{OC} has to meet following equations:

$$\frac{R2}{(R1 + R2)} \times DVDD = V_{DS}$$

where

- R1 + R2 ≥ 1 KΩ
- DVDD = 3.3 V   (3)

$$I_{OC} = \frac{V_{DS}}{R_{DS(on)}}$$

(4)

Connect OC_ADJ pin to DVDD to disable the over-current protection feature.
图 5. OC_ADJ Current Programming Pin Connection

7.3.4.3 Undervoltage Protection (UVLO)

To protect the power output stage during start-up, shutdown, and other possible undervoltage conditions, the DRV8302 provides undervoltage protection by driving the gate drive outputs (GH_X, GL_X) low whenever PVDD or GVDD are below their undervoltage thresholds (PVDD_UV/GVDD_UV). This will put the external MOSFETs in a high impedance state.

A specific PVDD1 undervoltage transient brownout from 13 to 15 µs can cause the DRV8302 to become unresponsive to external inputs until a full power cycle. The transient condition consists of having PVDD1 greater than the PVDD_UV level and then PVDD1 dropping below the PVDD_UV level for a specific period of 13 to 15 µs. Transients shorter or longer than 13 to 15 µs will not affect the normal operation of the undervoltage protection. Additional bulk capacitance can be added to PVDD1 to reduce undervoltage transients.

7.3.4.4 Overvoltage Protection (GVDD_OV)

The device will shut down both the gate driver and charge pump if the GVDD voltage exceeds the GVDD_OV threshold to prevent potential issues related to the GVDD pin or the charge pump (For example, short of external GVDD cap or charge pump). The fault is a latched fault and can only be reset through a reset transition on the EN_GATE pin.

7.3.4.5 Overtemperature Protection

A two-level overtemperature detection circuit is implemented:

- Level 1: overtemperature warning (OTW)
  OTW is reported through nOCTW pin.
- Level 2: overtemperature (OT) latched shut down of gate driver and charge pump (OTSD_GATE)
  Fault will be reported to nFAULT pin. This is a latched shut down, so gate driver will not be recovered automatically even if OT condition is not present anymore. An EN_GATE reset through pin is required to recover gate driver to normal operation after temperature goes below a preset value, t_{OTSD_CLR}.

7.3.4.6 Fault and Protection Handling

The nFAULT pin indicates an error event with shut down has occurred such as over-current, overtemperature, overvoltage, or undervoltage. Note that nFAULT is an open-drain signal. nFAULT goes high when gate driver is ready for PWM signal (internal EN_GATE goes high) during start-up.

The nOCTW pin indicates an overtemperature or over current event that is not necessarily related to shut down.

Following is the summary of all protection features and their reporting structure:

表 5. Fault and Warning Reporting and Handling

EVENT	ACTION	LATCH	REPORTING ON nFAULT PIN	REPORTING ON nOCTW PIN
PVDD undervoltage	External FETs HiZ; Weak pulldown of all gate driver output	N	Y	N
DVDD undervoltage	External FETs HiZ; Weak pulldown of all gate driver output; When recovering, reset all status registers	N	Y	N
GVDD undervoltage	External FETs HiZ; Weak pulldown of all gate driver output	N	Y	N
GVDD overvoltage	External FETs HiZ; Weak pulldown of all gate driver output Shut down the charge pump Won't recover and reset through SPI reset command or quick EN_GATE toggling	Y	Y	N
OTW	None	N	N	Y
OTSD_GATE	Gate driver latched shut down. Weak pulldown of all gate driver output to force external FETs HiZ Shut down the charge pump	Y	Y	Y
OTSD_BUCK	OTSD of Buck	Y	N	N
Buck output undervoltage	UVLO_BUCK: auto-restart	N	Y, in PWRGD pin	N
Buck overload	Buck current limiting (HiZ high side until current reaches zero and then auto-recovering)	N	N	N
External FET overload – current limit mode	External FETs current Limiting (only OC detected FET)	N	N	Y
External FET overload – Latch mode	Weak pulldown of gate driver output and PWM logic "0" of LS and HS in the same phase. External FETs HiZ	Y	Y	Y
External FET overload – reporting only mode	Reporting only	N	N	Y

7.4 Device Functional Modes

7.4.1 EN_GATE

EN_GATE low is used to put gate driver, charge pump, current shunt amplifier, and internal regulator blocks into a low-power consumption mode to save energy. The device will put the MOSFET output stage to high-impedance mode as long as PVDD is still present.

When the EN_GATE pin goes low to high, it goes through a power-up sequence, and enable gate driver, current amplifiers, charge pump, internal regulator, and so forth and reset all latched faults related to gate driver block. All latched faults can be reset when EN_GATE is toggled after an error event unless the fault is still present.

When EN_GATE goes from high to low, it will shut down gate driver block immediately, so gate output can put external FETs in high impedance mode. It will then wait for 10 μs before completely shutting down the rest of the blocks. A quick fault reset mode can be done by toggling EN_GATE pin for a very short period (less than 10 μs). This will prevent the device from shutting down the other functional blocks such as charge pump and internal regulators and bring a quicker and simple fault recovery. To perform a full reset, EN_GATE should be toggled for longer than 20 μs. This allows for all of the blocks to completely shut down and reach known states.

An EN_GATE reset pulse (high → low → high) from 10 to 20 μs should not be applied to the EN_GATE pin. The DRV8301 has a transition area from the quick to full reset modes that can cause the device to become unresponsive to external inputs until a full power cycle. An RC filter can be added externally to the pin if reset pulses with this period are expected to occur on the EN_GATE pin.

One exception is to reset a GVDD_OV fault. A quick EN_GATE quick fault reset will not work with GVDD_OV fault. A complete EN_GATE with low level holding longer than 20 μs is required to reset GVDD_OV fault. TI highly recommends inspecting the system and board when GVDD_OV occurs.

7.4.2 DTC

Dead time can be programmed through DTC pin. A resistor should be connected from DTC to ground to control the dead time. Dead time control range is from 50 ns to 500 ns. Short DTC pin to ground provides minimum dead time (50 ns). Resistor range is 0 to 150 kΩ. Dead time is linearly set over this resistor range. Current shoot-through prevention protection will be enabled in the device all time independent of dead time setting and input mode setting.

8 Application and Implementation

8.1 Application Information

The DRV8302 is a gate driver designed to drive a 3-phase BLDC motor in combination with external power MOSFETs. The device provides a high level of integration with three half-bridge gate drivers, two current shunt amplifiers, overcurrent protection, and a step-down buck regulator.

8.1.1 Gate Driver Power Up Sequencing Errdata

The DRV8301 gate drivers may not correctly power-up if a voltage greater than 8.5 V is present on any SH_X pin when EN_GATE is brought logic high (device enabled) after PVDD1 power is applied (PVDD1 > PVDD_UV). This sequence should be avoided by ensuring the voltage levels on the SH_X pins are less than 8.5 V when the DRV8301 is enabled through EN_GATE.

8.2 Typical Application
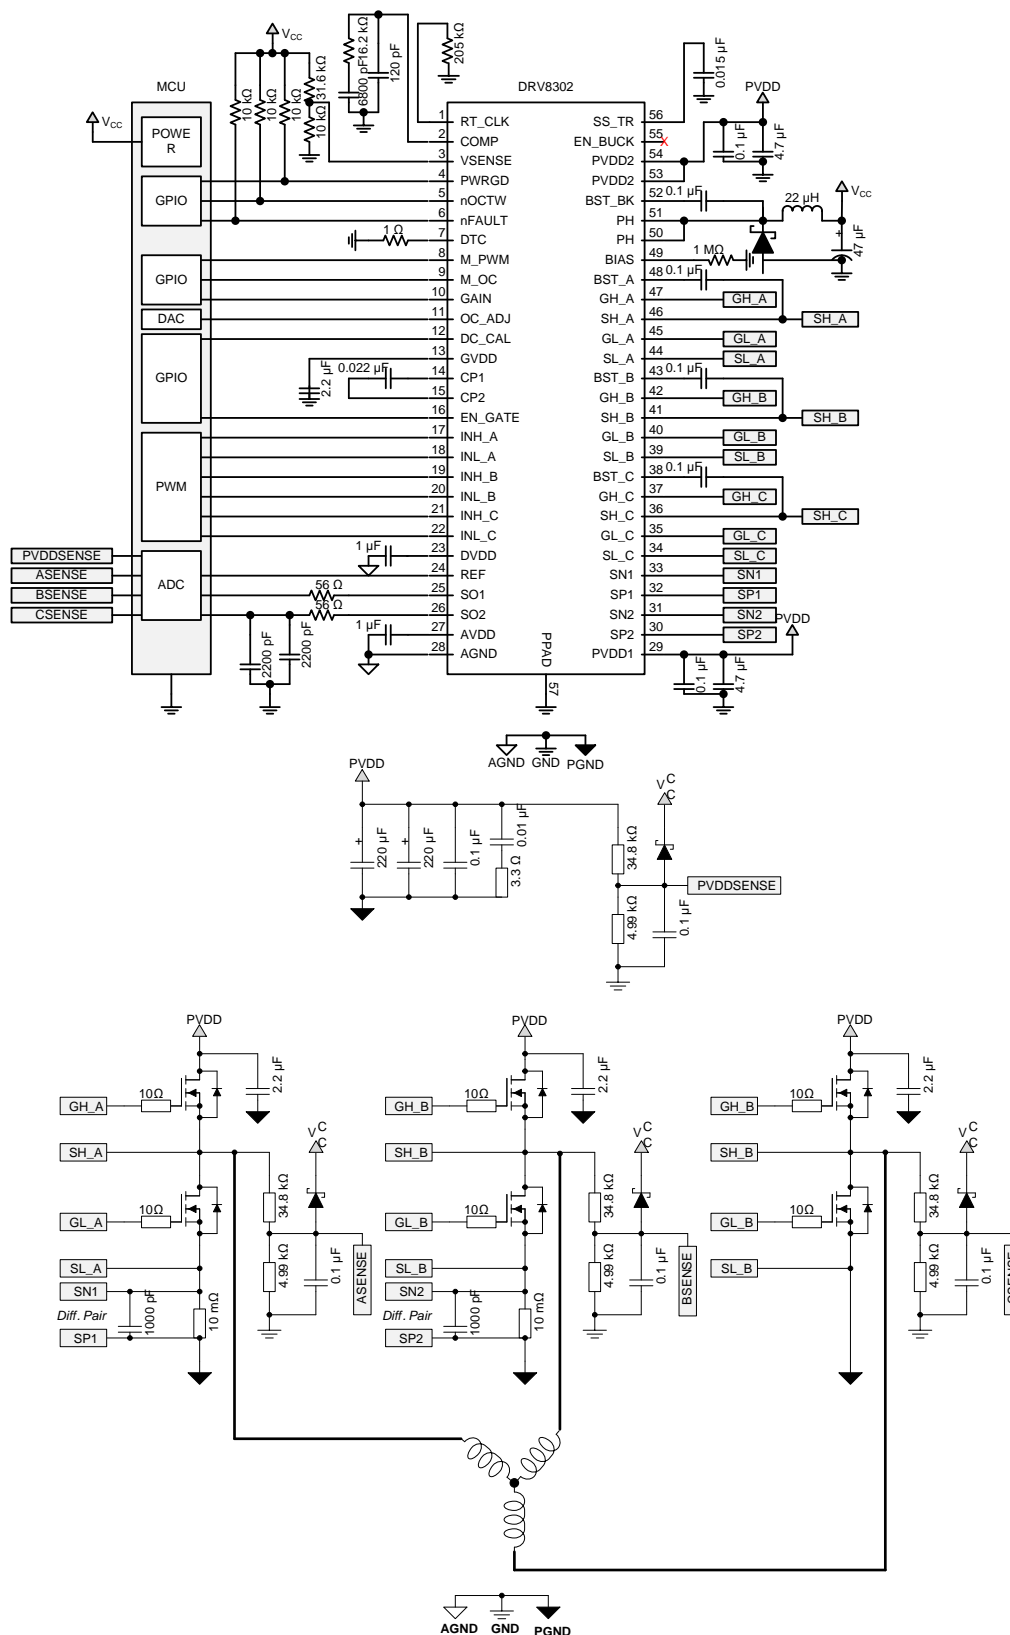

图 6. Typical Application Schematic

Typical Application (接下页)

Example:
Buck: PVDD = 3.5 V – 40 V, Iout_max = 1.5 A, Vo = 3.3 V, Fs = 570 kHz

8.2.1 Design Requirements

Motor winding resistance	M_R	0.5 Ω
Motor winding inductance	M_L	0.28 mH
Motor poles	M_P	16 poles
Motor rated RPM	M_{RPM}	4000 RPM
Target full-scale current	I_{MAX}	14 A
Sense resistor	R_{SENSE}	0.01 Ω
MOSFET Q_g	Q_g	29 nC
MOSFET $R_{DS(on)}$	$R_{DS(on)}$	4.7 mΩ
VDS trip level	OC_ADJ_SET	0.123 V
Switching frequency	f_{SW}	45 kHz
Series gate resistance	R_{GATE}	10 Ω
Amplifier reference	V_{REF}	3.3 V
Amplifier gain	Gain	10 V/V

8.2.2 Detailed Design Procedure

8.2.2.1 Gate Drive Average Current Load

The gate drive supply (GVDD) of the DRV8302 can deliver up to 30 mA (RMS) of current to the external power MOSFETs. Use 公式 5 to determine the approximate RMS load on the gate drive supply:

Gate Drive RMS Current = MOSFET Qg × Number of Switching MOSFETs × Switching Frequency (5)

Example:

7.83 mA = 29 nC × 6 × 45 kHz (6)

This is a rough approximation only.

8.2.2.2 Overcurrent Protection Setup

The DRV8302 provides overcurrent protection for the external power MOSFETs through the use of VDS monitors for both the high side and low side MOSFETs. These are intended for protecting the MOSFET in overcurrent conditions and not for precise current regulation.

The overcurrent protection works by monitoring the VDS voltage of the external MOSFET and comparing it against the OC_ADJ pin voltage. If the VDS exceeds the OC_ADJ pin voltage the DRV8302 takes action according to the M_OC pin.

Overcurrent Trip = OC_ADJ_SET / MOSFET $R_{DS(on)}$ (7)

Example:

26.17 A = 0.123 V/ 4.7 mΩ (8)

MOSFET $R_{DS(on)}$ changes with temperature and this will affect the overcurrent trip level.

8.2.2.3 Sense Amplifier Setup

The DRV8302 provides two bidirectional low-side current shunt amplifiers. These can be used to sense a sum of the three half-bridges, two of the half-bridges individually, or in conjunction with an additional shunt amplifier to sense all three half-bridges individually.

1. Determine the peak current that the motor will demand (I_{MAX}). This will be dependent on the motor

parameters and your specific application. $I_{(MAX)}$ in this example is 14 A.

2. Determine the available voltage range for the current shunt amplifier. This will be ± half of the amplifier reference voltage (V_{REF}). In this case the available range is ±1.65 V.

3. Determine the sense resistor value and amplifier gain settings. There are common tradeoffs for both the sense resistor value and amplifier gain. The larger the sense resistor value, the better the resolution of the half-bridge current. This comes at the cost of additional power dissipated from the sense resistor. A larger gain value will allow you to decrease the sense resistor, but at the cost of increased noise in the output signal. This example uses a 0.01-Ω sense resistor and the minimum gain setting of the DRV8302 (10 V/V). These values allow the current shunt amplifiers to measure ±16.5 A (some additional margin on the 14-A requirement).

9 Power Supply Recommendations

9.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The capacitance of the power supply and its ability to source or sink current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed DC, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system will respond to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

图 11. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

10 Layout

10.1 Layout Guidelines

Use these layout recommendations when designing a PCB for the DRV8302.

- The DRV8302 makes an electrical connection to GND through the PowerPAD. Always check to ensure that the PowerPAD has been properly soldered (See the application report, *PowerPAD™ Thermally Enhanced Package* application report, SLMA002).
- PVDD bypass capacitors should be placed close to their corresponding pins with a low impedance path to device GND (PowerPAD).
- GVDD bypass capacitor should be placed close its corresponding pin with a low impedance path to device GND (PowerPAD).
- AVDD and DVDD bypass capacitors should be placed close to their corresponding pins with a low impedance path to the AGND pin. It is preferable to make this connection on the same layer.
- AGND should be tied to device GND (PowerPAD) through a low impedance trace/copper fill.
- Add stitching vias to reduce the impedance of the GND path from the top to bottom side.
- Try to clear the space around and underneath the DRV8302 to allow for better heat spreading from the PowerPAD.

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8302DCA	ACTIVE	HTSSOP	DCA	56	35	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8302	Samples
DRV8302DCAR	ACTIVE	HTSSOP	DCA	56	2000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8302	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES: A.   All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M−1994.
         B.   This drawing is subject to change without notice.
         C.   Body dimensions do not include mold flash or protrusion not to exceed 0,15.
         D.   This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad
              Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding
              recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
         E.   See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
   F.   Falls within JEDEC MO−153

PowerPAD is a trademark of Texas Instruments.

DCA (R–PDSO–G56)   PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

NOTES:　A.　All linear dimensions are in millimeters.
　　　　B.　This drawing is subject to change without notice.
　　　　C.　Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
　　　　D.　This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad
　　　　　　Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets
　　　　　　for specific thermal information, via requirements, and recommended board layout. These documents are available at
　　　　　　www.ti.com <http://www.ti.com>. Publication IPC–7351 is recommended for alternate designs.
　　　　E.　Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should
　　　　　　contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric
　　　　　　metal load solder paste. Refer to IPC–7525 for other stencil recommendations.
　　　　F.　Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
