

具有输出波形整形的 11.35Gbps 差分调制器驱动器

查询样品: [ONET1151M](#)

特性

- 1.5V_{pp}单端输出电压进入一个 50Ω 负载
- 可编程输入均衡器
- 输出预加重
- 可调上升和下降时间
- 交叉点控制
- 输出极性选择
- 2 线制数字接口
- 3.3V 单电源

- -40°C 至 100°C 运行
- 表明贴装 3mm x 3mm 16 引脚符合 RoHS 环保标准的四方扁平无引线 (QFN) 封装

应用范围

- SONET OC-192/SDH STM-64 光发射器
- 10G 以太网光发射器
- SFP+ 和 XFP 收发器模块

说明

ONET1151M 是一款高速, 3.3V 调制器驱动器, 此驱动器设计用来调制一个数据速率介于 1Gbps 到最高 11.35Gbps 的差分驱动马赫-曾德尔 (Mach Zehnder) 调制器。

可使用一个外部施加的电压来控制输出摆幅。一个 2 线制接口可实现对均衡器、输出预加重、眼图交叉点、上升和下降时间以及摆幅的数字控制, 从而免除了对于外部组件的需要。提供以预加重、交叉点调整以及上升和下降时间调整的形式进行输出波形控制来改进光眼图模板容限。

一个 5GHz 时具有 10dB 提升的可选输入均衡器可被用于实现 FR4 印刷电路板上微带线和带状线传输线路的高达 300mm (12 英寸) 的均衡。

此调制器驱动器可在外壳温度介于 -40°C 至 100°C 时运行并采用一个小型封装 3mm x 3mm 16 引脚并与 RoHS 环保标准兼容的 QFN 封装。

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

BLOCK DIAGRAM

Figure 1 shows a simplified block diagram of the ONET1151M. The modulator driver consists of an equalizer, a limiter, an output driver, power-on reset circuitry, a 2-wire serial interface including a control logic block, a modulation current generator, and an analog reference block.

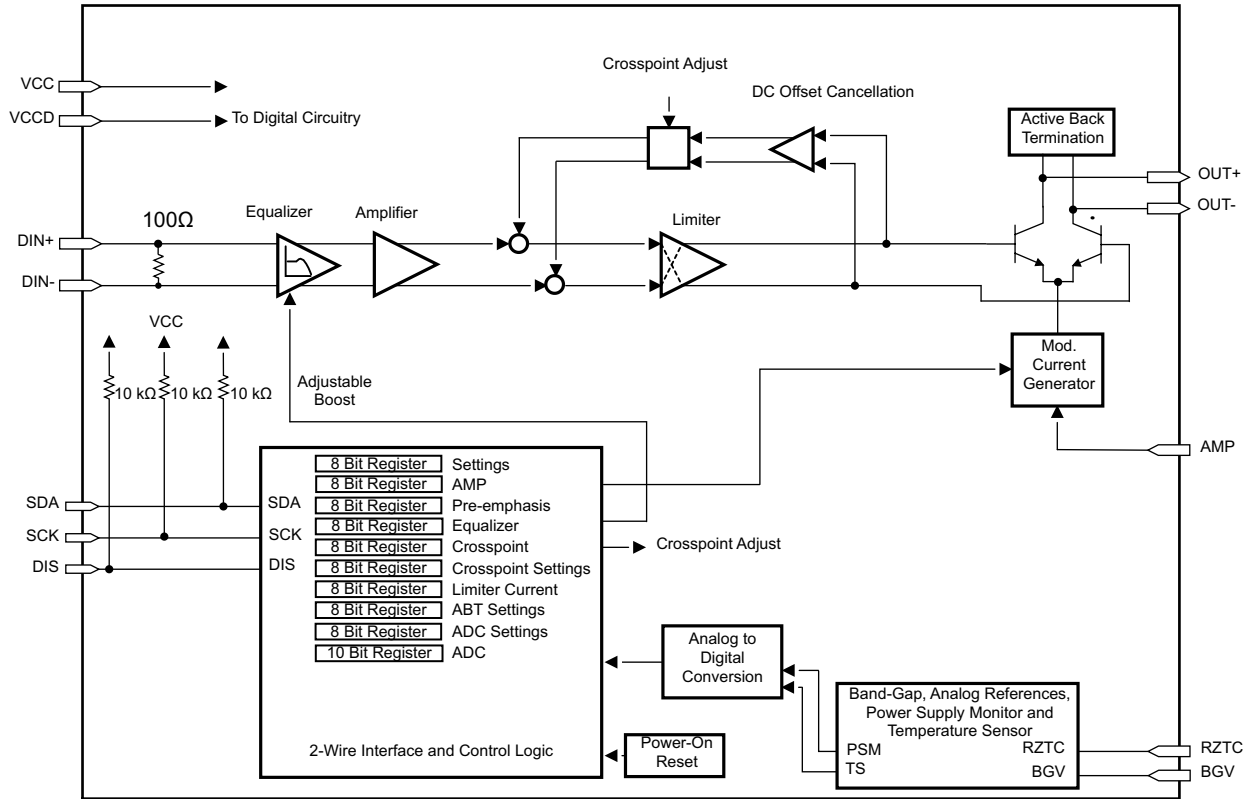

Figure 1. Simplified Block Diagram of the ONET1151M

PACKAGE

The ONET1151M is packaged in a small footprint 3-mm x 3-mm 16-pin RoHS compliant QFN package with a lead pitch of 0.5 mm.

Figure 2. 16-Pin QFN Package, 3-mm x 3-mm (Top View)

Table 1. PIN DESCRIPTIONS

PIN		TYPE	DESCRIPTION
NAME	NO.		
DIS	1	Digital-in	Disables bias, modulation, and peaking currents when set to high state. Includes a 10-kΩ or 40-kΩ pullup resistor to VCC.
VCCD	2	Supply	3.3 V ± 10% supply voltage for the digital logic. Connect to VCC.
SCK	3	Digital-in	2-wire interface serial clock. Includes a 10-kΩ or 40-kΩ pullup resistor to VCC.
SDA	4	Digital-in/out	2-wire interface serial data input. Includes a 10-kΩ or 40-kΩ pullup resistor to VCC.
GND	5, 8, 12	Supply	Circuit ground
DIN+	6	Analog-in	Non-inverted data input. On-chip differentially 100-Ω terminated to DIN-. Must be AC coupled.
DIN-	7	Analog-in	Inverted data input. On-chip differentially 100-Ω terminated to DIN+. Must be AC coupled.
RZTC	9	Analog	Connect external zero TC 28.7-kΩ resistor to ground (GND). Used to generate a defined zero TC reference current for internal DACs.
BGV	10	Analog-out	Buffered bandgap voltage with 1.16-V output. This is a replica of the bandgap voltage at RZTC.
AMP	11	Analog-in	Output amplitude control. Output amplitude can be adjusted by applying a voltage of 0 to 2.5 V to this pin.
VCC	13, 16	Supply	3.3 V ± 10% supply voltage. Connect to VCCD.
OUT-	14	CML-out (current)	Inverted data output
OUT+	15	CML-out (current)	Non-inverted data output
EP	EP	Thermal	Exposed die pad (EP) must be grounded.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range (unless otherwise noted)

PARAMETER		VALUE		UNIT
		MIN	MAX	
V_{CC}	Supply voltage ⁽²⁾	-0.3	4	V
V_{DIS} , V_{RZTC} , V_{SCK} , V_{SDA} , V_{BGV} , V_{AMP} , V_{DIN+} , V_{DIN-} , V_{OUT+} , V_{OUT-}	Voltage at DIS, RZTC, SCK, SDA, BGV, AMP, DIN+, DIN-, OUT+, OUT- ⁽²⁾	-0.3	4	V
I_{DIN-} , I_{DIN+}	Max. current at input pins		25	mA
I_{MOD+} , I_{MOD-}	Max. current at output pins		35	mA
ESD	ESD rating at all pins except OUT+ and OUT-		2	kV (HBM)
	ESD rating at OUT+ and OUT-		1.5	kV (HBM)
$T_{J, max}$	Maximum junction temperature		125	°C
T_{STG}	Storage temperature range	-65	150	°C
T_C	Case temperature	-40	110	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

PARAMETER	CONDITION	VALUE			UNIT
		MIN	TYP	MAX	
V_{CC}	Supply voltage	2.97	3.3	3.63	V
V_{IH}	Digital input high voltage	2			V
V_{IL}	Digital input low voltage	0.8			V
R_{RZTC}	Zero TC resistor value ⁽¹⁾	28.4	28.7	29	k Ω
V_{IN}	Differential input voltage swing	150	1200		mV _{p-p}
V_{AMP}	Amplitude control input voltage range	0	2.5		V
t_{R-IN}	Input rise time	20%–80%			ps
t_{F-IN}	Input fall time	20%–80%			ps
T_C	Temperature at thermal pad	-40	100		°C

- (1) Changing the value alters the DAC ranges and the current consumption.

DC ELECTRICAL CHARACTERISTICS

over recommended operating conditions with 50-Ω output load, $V_{OUT+} = 1.5 V_{PP}$ and $R_{RZTC} = 28.7 \text{ k}\Omega$, unless otherwise noted. Typical operating condition is at 3.3 V and $T_A = 25^\circ\text{C}$

PARAMETER	CONDITION	VALUE			UNIT
		MIN	TYP	MAX	
V_{CC}	Supply voltage	2.97	3.3	3.63	V
I_{VCC}	Supply current	$V_{CC} = 3.47 \text{ V}$, PKENA = 1			100
		$V_{CC} = 3.63 \text{ V}$, PKENA = 1			105
P	Power Dissipation	$V_{CC} = 3.47 \text{ V}$, PKENA = 1			347
		$V_{CC} = 3.63 \text{ V}$, PKENA = 1			381
R_{IN}	Data input resistance	Differential between DIN+ / DIN-			Ω
I_{IH}	High level digital input current	SCK, SDA, DIS set to V_{CC} ⁽¹⁾			μA
I_{IL}	Low level digital input current	SCK, SDA, DIS set to GND ⁽¹⁾			μA
V_{CC-RST}	V_{CC} reset threshold voltage	V_{CC} voltage level which triggers power-on reset			V
$V_{CC-RSTHYS}$	V_{CC} reset threshold voltage hysteresis				mV

(1) Assured by simulation over process, supply and temperature variation

AC ELECTRICAL CHARACTERISTICS

over recommended operating conditions with 50-Ω output load, $V_{OUT+} = 1.5 V_{PP}$ and $R_{RZTC} = 28.7 \text{ k}\Omega$ unless otherwise noted. Typical operating condition is at $V_{CC} = 3.3 \text{ V}$ and $T_A = 25^\circ\text{C}$.

PARAMETER	CONDITION	VALUE			UNIT
		MIN	TYP	MAX	
	Data rate				Gbps
SDD11	Differential input return gain	0.01 GHz < f < 5 GHz			-15
		5 GHz < f < 11.1 GHz			-8
SCD11	Differential to common mode conversion gain	0.01 GHz < f < 11.1 GHz			dB
V_{O-MIN}	Minimum output amplitude	50-Ω load, single-ended			mV _{PP}
V_{O-MAX}	Maximum output amplitude	50-Ω load, single-ended, OASH0 = OASH1 = 0			V _{PP}
	Output amplitude stability	50-Ω load, single-ended			mV
t_{R-OUT}	Output rise time	20% – 80%, $t_{R-IN} < 40 \text{ ps}$, 50-Ω load, single-ended, cross point = 50%. ⁽¹⁾			ps
t_{F-OUT}	Output fall time	20% – 80%, $t_{F-IN} < 40 \text{ ps}$, 50-Ω load, single-ended, cross point = 50%. ⁽¹⁾			ps
ISI	Intersymbol interference ⁽²⁾	EQENA = 0, K28.5 pattern at 11.35 Gbps, 150-mV _{PP} , 600-mV _{PP} , 1200-mV _{PP} differential input voltage, single-ended output. $750 \text{ mV}_{PP} \leq V_{OUT} \leq 1.5 V_{PP}$			ps _{p-p}
		EQENA = 1, K28.5 pattern at 11.35 Gbps with 12-inch transmission line at the input, 150-mV _{PP} , 600-mV _{PP} , 1200-mV _{PP} input to transmission line, single-ended output. $750 \text{ mV}_{PP} \leq V_{OUT} \leq 1.5 V_{PP}$.			
RJ	Random output jitter	EQENA = 0			ps _{RMS}
	High cross point control range	50-Ω load, single-ended			%
	Low cross point control range	50-Ω load, single-ended			%

(1) 1010 pattern with PKENA = 1 and PEADJ (Register 2) set to 0x0F.

(2) Jitter at the eye crossing point.

AC ELECTRICAL CHARACTERISTICS (continued)

over recommended operating conditions with 50-Ω output load, $V_{OUT+} = 1.5 V_{PP}$ and $R_{RZTC} = 28.7 \text{ k}\Omega$ unless otherwise noted. Typical operating condition is at $V_{CC} = 3.3 \text{ V}$ and $T_A = 25^\circ\text{C}$.

PARAMETER	CONDITION	VALUE			UNIT
		MIN	TYP	MAX	
Cross point stability	50-Ω load, single-ended, $V_{IN} = 180 \text{ mV}_{PP}$, 600 mV_{PP} and 1200 mV_{PP} , $V_{OUT} = 1.2 V_{PP}$		±5		pp
Cross point stability vs. input amplitude	50-Ω load, single-ended, $V_{IN} = 180 \text{ mV}_{PP}$, 600 mV_{PP} and 1200 mV_{PP} , $V_{OUT} = 1.2 V_{PP}$	-6		6	pp
BW_{AMP} Bandwidth of AMP input			2.5		kHz
T_{OFF} Transmitter disable time	Rising edge of DIS to $V_{OUT+} \leq 0.15 V_{PP}$ ⁽³⁾		0.05	5	μs
T_{ON} Disable negate time	Falling edge of DIS to $V_{OUT+} \geq 1.2 V_{PP}$ ⁽³⁾			1	ms
T_{INIT1} Power-on to initialize	Power-on to registers ready to be loaded ⁽³⁾		1	10	ms
T_{INIT2} Initialize to transmit	Register load STOP command to part ready to transmit valid data ⁽³⁾			2	ms

(3) Assured by simulation over process, supply, and temperature variation.

DETAILED DESCRIPTION

EQUALIZER

The data signal is applied to an input equalizer by means of the input signal pins DIN+ / DIN–, which provide on-chip differential 100-Ω line-termination. The equalizer is enabled by setting EQENA to 1 (bit 1 of register 0). Equalization of up to 300-mm (12 in.) of microstrip or stripline transmission line on FR4 printed circuit boards can be achieved. The amount of equalization is digitally controlled by the 2-wire interface and control logic block and is dependant on the register settings EQADJ[0..7] (register 3). The equalizer can be turned off and bypassed by setting EQENA to 0. For details about the equalizer settings, see [Table 16](#).

LIMITER

By limiting the output signal of the equalizer to a fixed value, the limiter removes any overshoot after the input equalization and provides the input signal for the output driver. Adjustments to the limiter bias current and emitter follower current can be made to trade off the rise and fall times and supply current. The limiter bias current is adjusted through LIMCSGN (bit 7 of register 6) and LIMC[0..2] (bits 4, 5 and 6 of register 6). The emitter follower current is adjusted through EFCSGN (bit 3 of register 6) and EFC[0..2] (bits 0, 1 and 2 of register 6). In addition, the slope of the emitter follower current can be modified with the EFCRNG bit (bit 3 of register 5). Setting EFCRNG to 1 results in a steeper slope.

HIGH-SPEED OUTPUT DRIVER

The modulation current is sunk from the common emitter node of the limiting output driver differential pair by means of a modulation current generator, which is digitally controlled by the 2-wire serial interface. The collector nodes of the output stages are connected to the output pins OUT+ and OUT–. The collectors have internal active back termination. The outputs are optimized to drive a 50-Ω single-ended load and to obtain the maximum single-ended output voltage of 1.5 V_{PP}. AC coupling and inductive pullups to VCC are required. The active back termination emitter follower current is adjusted through ABTSGN (bit 3 of register 7) and ABTEF[0..2] (bits 0, 1 and 2 of register 7). ABTUP (bit 7 of register 7) and ABTDWN (bit 6 of register 7) can control the active back termination auxiliary buffer amplitude. Setting ABTUP to 1 increases the amplitude and setting ABTDWN to 1 decreases the amplitude. For most instances, these settings may be left in the default mode.

For waveform shaping, output pre-emphasis can be enabled by setting PKENA to 1 (bit 5 of register 0) and adjusting the peaking height through PEADJ[0..3] (register 2).

In addition, the polarity of the output pins can be inverted by setting the output polarity switch bit, POL (bit 2 of register 0) to 1.

MODULATION CURRENT GENERATOR

The modulation current generator provides the current for the current modulator described above. The modulation current generator is controlled by applying an analog voltage in the range of 0 to 2.5 V to the AMP pin, or it can be digitally controlled by the 2-wire interface block. The default method of control is through the AMP pin. To digitally control the output amplitude set AMPCTRL (bit 0 of register 0) to 1.

An 8-bit wide control bus, AMP[0..7] (register 1), can be used to set the desired modulation current, and therefore, the output voltage.

To decrease the output amplitude by approximately 18% set OARNG to 1 (bit 7 of register 5), to increase it by approximately 30 mV_{PP} set OASH0 (bit 5 of register 5) to 1, or to increase it by approximately 60 mV_{PP} set OASH1 (bit 6 of register 5) to 1.

The modulation current, and therefore the output signal, can be disabled by setting the DIS input pin to a high level or by setting ENA to 0 (bit 7 of register 0).

DC OFFSET CANCELLATION AND CROSS POINT CONTROL

The ONET1151M has DC offset cancellation to compensate for internal offset voltages. The offset cancellation can be disabled and the eye crossing point adjustment enabled by setting CPENA to 1 (bit 3 of register 0). The crossing point can be moved toward the one level by setting CPSGN to 0 (bit 7 of register 4) and it can be moved toward the zero level by setting CPSGN to 1. The percentage of shift depends upon the register settings CPADJ[0..6] (register 4) and the high cross point adjustment range bits HICP[0..1] (bits 0 and 1 of register 5). Setting HICP0 and HICP1 to 1 results in the maximum adjustment range but increases the supply current.

ANALOG REFERENCE AND TEMPERATURE SENSOR

The ONET1151M modulator driver is supplied by a single 3.3-V \pm 10% supply voltage connected to the VCC and VCCD pins. This voltage is referred to ground (GND) and can be monitored as a 10-bit unsigned digital word through the 2-wire interface.

On-chip bandgap voltage circuitry generates a reference voltage, independent of the supply voltage, from which all other internally required voltages and bias currents are derived.

An external zero temperature coefficient resistor must be connected from the RZTC pin of the device to ground. This resistor is used to generate a precise, zero-TC current which is required as a reference current for the on-chip DACs.

In order to minimize the module component count, the ONET1151M provides an on-chip temperature sensor. The temperature can be monitored as a 10-bit unsigned digital word through the 2-wire interface.

POWER-ON RESET

The ONET1151M has power on reset circuitry which ensures that all registers are reset to zero during startup. After the power-on to initialize time (t_{INIT1}), the internal registers are ready to be loaded. The part is ready to transmit data after the initialize to transmit time (t_{INIT2}), assuming that the chip enable bit ENA is set to 1 and the disable pin DIS is low. The DIS pin has an internal 10-k Ω pullup resistor so the pin must be pulled low to enable the outputs.

The ONET1151M can be disabled using either the ENA control register bit or the disable pin DIS. In both cases the internal registers are not reset. After the disable pin DIS is set low and/or the enable bit ENA is set back to 1, the part returns to its prior output settings.

ANALOG TO DIGITAL CONVERTER

The ONET1151M has an internal 10-bit analog to digital converter (ADC) that converts the analog monitors for temperature and power supply voltage into a 10-bit unsigned digital word. The first eight most significant bits (MSBs) are available in register 14 and the two least significant bits (LSBs) are available in register 15. Depending on the accuracy required, eight bits or 10 bits can be read. However, due to the architecture of the 2-wire interface, in order to read the two registers, two separate read commands have to be sent.

The ADC is enabled by default. To monitor a particular parameter, select the parameter with ADCSEL (bit 0 of register 13). [Table 2](#) lists the ADCSEL bits and the monitored parameters.

Table 2. ADC Selection Bits and the Monitored Parameter

ADCSEL	Monitored Parameter
0	Temperature
1	Supply voltage

If it is not desired to use the ADC to monitor the two parameters then the ADC can be disabled by setting ADCDIS to 1 (bit 7 of register 13) and OSCDIS to 1 (bit 6 of register 13).

The digital word read from the ADC can be converted to its analog equivalent through the following formulas:

Temperature without a mid point calibration:

$$\text{Temperature (}^{\circ}\text{C)} = \frac{(\text{ADCx} - 264)}{6}$$

Temperature with a mid point calibration:

$$\text{Temperature (}^{\circ}\text{C)} = \frac{(T_{\text{cal}} (^{\circ}\text{C}) + 273) \times (\text{ADCx} + 1362)}{(\text{ADC}_{\text{cal}} + 1362) - 273}$$

Power supply voltage:

$$\text{Power supply voltage (V)} = \frac{2.25 \times (\text{ADCx} + 1380)}{1409}$$

2-WIRE INTERFACE AND CONTROL LOGIC

The ONET1151M uses a 2-wire serial interface for digital control. For example, the two circuit inputs, SDA and SCK, are respectively driven by the serial data and serial clock from a microprocessor. The SDA and SCK pins have internal 10-k Ω pullups to VCC. If a common interface is used to control multiple parts, the internal pullups can be set to 40 k Ω by setting HITERM to 1 (bit 6 of register 0). The internal pullup for the DIS pin is also set to 40 k Ω when HITERM is set to 1.

The 2-wire interface allows write access to the internal memory map to modify control registers and read access to read out the control signals. The ONET1151M is a slave device only which means that it cannot initiate a transmission itself; it always relies on the availability of the SCK signal for the duration of the transmission. The master device provides the clock signal as well as the START and STOP commands. The protocol for a data transmission is as follows:

1. START command
2. 7-bit slave address (0001000) followed by an eighth bit which is the data direction bit (R/W). A zero indicates a WRITE and a 1 indicates a READ.
3. 8-bit register address
4. 8-bit register data word
5. STOP command

Regarding timing, the ONET1151M is I²C™ compatible. The typical timing is shown in [Figure 3](#) and complete data write and read transfers are shown in [Figure 4](#). Parameters for [Figure 3](#) are defined in [Table 3](#).

Bus Idle: Both SDA and SCK lines remain HIGH.

Start Data Transfer: A START condition (S) is defined by a change in the state of the SDA line from HIGH to LOW while the SCK line is HIGH. Each data transfer is initiated with a START condition.

Stop Data Transfer: A STOP condition (P) is defined by a change in the state of the SDA line from LOW to HIGH while the SCK line is HIGH. Each data transfer is terminated with a STOP condition. However, if the master still wishes to communicate on the bus, it can generate a repeated START condition and address another slave without first generating a STOP condition.

Data Transfer: Only one data byte can be transferred between a START and a STOP condition. The receiver acknowledges the transfer of data.

Acknowledge: Each receiving device, when addressed, is obligated to generate an acknowledge bit. The transmitter releases the SDA line and a device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a slave-receiver does not acknowledge the slave address, the data line must be left HIGH by the slave. The master can then generate a STOP condition to abort the transfer. If the slave-receiver does acknowledge the slave address but some time later in the transfer cannot receive any more data bytes, the master must abort the transfer. This is indicated by the slave generating the not acknowledge on the first byte to follow. The slave leaves the data line HIGH and the master generates the STOP condition.

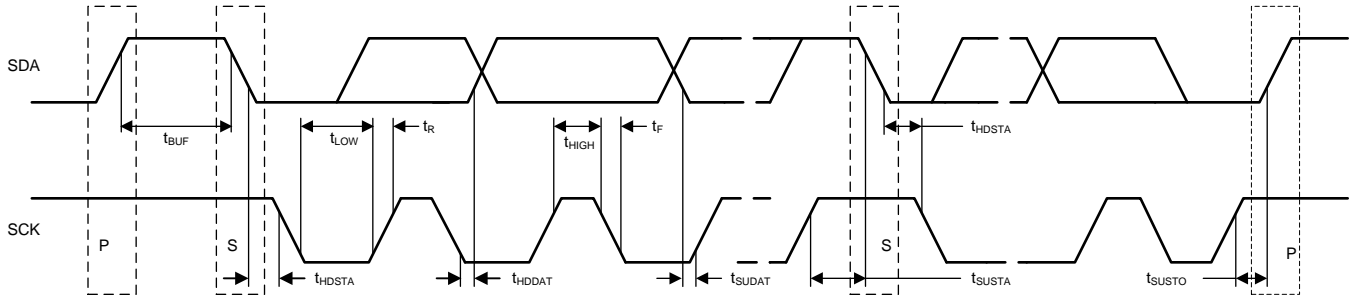

Figure 3. I²C Timing Diagram

Table 3. Timing Diagram Definitions

Parameter	Symbol	Min	Max	Unit
SCK clock frequency	f_{SCK}		400	kHz
Bus free time between STOP and START conditions	t_{BUF}	1.3		μ s
Hold time after repeated START condition. After this period, the first clock pulse is generated	t_{HDSTA}	0.6		μ s
Low period of the SCK clock	t_{LOW}	1.3		μ s
High period of the SCK clock	t_{HIGH}	0.6		μ s
Setup time for a repeated START condition	t_{SUSTA}	0.6		μ s
Data HOLD time	t_{HDDAT}	0		μ s
Data setup time	t_{SUDAT}	100		ns
Rise time of both SDA and SCK signals	t_R		300	ns
Fall time of both SDA and SCK signals	t_F		300	ns
Setup time for STOP condition	t_{SUSTO}	0.6		μ s

	4	EQADJ4	
	3	EQADJ3	
	2	EQADJ2	
	1	EQADJ1	
	0	EQADJ0	

Table 16. Register Functionality (continued)

Register	Bit	Symbol	Function
4	7	CPSGN	Eye cross-point adjustment setting
	6	CPADJ6	CPSGN = 0 (positive shift)
	5	CPADJ5	Maximum shift for 1111111
	4	CPADJ4	Minimum shift for 0000000
	3	CPADJ3	CPSGN = 1 (negative shift)
	2	CPADJ2	Maximum shift for 1111111
	1	CPADJ1	Minimum shift for 0000000
	0	CPADJ0	
5	7	OARNG	Output amplitude range bit: 1 = Decrease output amplitude by approximately 18% 0 = Default range
	6	OASH1	Upper output amplitude shift bit: 1 = Output amplitude shifted upwards by approximately 60 mV _{PP} 0 = Default
	5	OASH0	Lower output amplitude shift bit: 1 = Output amplitude shifted upwards by approximately 30 mV _{PP} 0 = Default
	4	-	
	3	EFCRNG	Emitter follower current slope selection: 1 = Step slope 0 = Shallow slope
	2	-	
	1 0	HICP1 HICP0	High cross point adjustment range bits: 00 = Default adjustment range 11 = Maximum increase in the adjustment range
6	7	LIMCSGN	Limiter bias current sign bit: 1 = Decrease limiter bias current 0 = Increase limiter bias current
	6 5 4	LIMC2 LIMC1 LIMC0	Limiter bias current selection bits: 000 = No change 111 = Maximum current change
	3	EFCSGN	Emitter follower current sign bit: 1 = Increase emitter follower current 0 = Decrease emitter follower current
	2 1 0	EFC2 EFC1 EFC0	Emitter follower current selection bits: 000 = No change 111 = Maximum current change
	7	7	ABTUP
6		ABTDWN	Active back termination auxiliary buffer amplitude control bit: 1 = Decrease amplitude 0 = Default setting
5		-	
4		-	
3		ABTSGN	Active back termination emitter follower current sign bit: 1 = Increase emitter follower current 0 = Decrease emitter follower current
2 1 0		ABTEF2 ABTEF1 ABTEF0	Active back termination emitter follower current selection bits: 000 = No change 111 = Maximum current change

Table 16. Register Functionality (continued)

Register	Bit	Symbol	Function
13	7	ADCDIS	ADC disable bit: 1 = ADC disabled 0 = ADC enabled
	6	OSCDIS	ADC oscillator bit: 1 = Oscillator disabled 0 = Oscillator enabled
	5	-	
	4	-	
	3	-	
	2	-	
	1	-	
	0	ADCSEL	ADC input selection bits: 1 = Supply monitor 0 = Temperature sensor
14	7	ADC9 (MSB)	Digital representation of the ADC input source (read only)
	6	ADC8	
	5	ADC7	
	4	ADC6	
	3	ADC5	
	2	ADC4	
	1	ADC3	
	0	ADC2	
15	7	-	
	6	-	
	5	-	
	4	-	
	3	-	
	2	-	
	1	ADC1	
	0	ADC0 (LSB)	

APPLICATION INFORMATION

Figure 5 shows a typical application circuit using the ONET1151M. The modulator must be AC coupled to the driver for proper operation. The output amplitude is controlled through the AMP pin and the rest of the functions are controlled through the 2-wire interface (SDA or SCK) by a microcontroller.

Pullup inductors from MOD+ and MOD- to VCC are required.

Figure 5. Differential AC Coupled Drive

Layout Guidelines

For optimum performance, use 50-Ω transmission lines (100-Ω differential) for connecting the signal source to the DIN+ and DIN- pins and 50-Ω transmission lines (100-Ω differential) for connecting the OUT+ and OUT- modulation current outputs to the modulator. The length of the transmission lines should be kept as short as possible to reduce loss and pattern-dependent jitter.

In addition, VCCD can be connected to VCC and filtered from a common supply.

TYPICAL CHARACTERISTICS

Typical operating condition is at $V_{CC} = 3.3\text{ V}$, $T_A = 25^\circ\text{C}$, $V_{OUT} = 1.5\text{ V}_{PP}$ single ended, EQENA = 0, PKENA = 1 with PEADJ = 0x0F and $V_{IN} = 600\text{ mV}_{PP}$ (unless otherwise noted).

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ONET1151MRGTR	ACTIVE	VQFN	RGT	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 100	1151M	Samples
ONET1151MRGTT	ACTIVE	VQFN	RGT	16	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 100	1151M	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
