

具有电源正常状态指示功能的 TPS7A25 300mA、18V、超低 I_Q 、低压降线性稳压器

1 特性

- 超低 I_Q : 2 μ A
- 输入电压: 2.4V 至 18V
- 可用输出电压选项:
 - 固定电压: 1.25V 至 5.5V
 - 可调节电压: 1.24V 至 17.66V
- 在温度范围内的精度为 1%
- 低压降: 电流 300mA 时为 340mV (最大值)
- 开漏电源正常状态输出
- 热关断保护和过流保护
- 主动过冲下拉
- 工作结温范围: -40°C 至 +125°C
- 与 1 μ F 输出电容器一起工作时保持稳定
- 封装: 6 引脚 WSON

2 应用

- 家庭和楼宇自动化
- 多电池移动电源
- 智能电网和计量
- 便携式电动工具
- 电机驱动器
- 白色家电
- 便携式电器

3 说明

TPS7A25 低压降 (LDO) 线性稳压器集 2.4V 至 18V 输入电压范围和极低静态电流 (I_Q) 特性于一体。这些功能可更好地帮助现代电器满足日益严苛的能源要求,并有助于延长便携式电源解决方案的电池寿命。

TPS7A25 有固定电压和可调节电压两种版本可供选用。为获得更大的灵活性或更高的输出电压,可调节电压版本使用反馈电阻器将输出电压从 1.24V 提升到了 17.64V。两种版本都具有 1% 的输出调节精度,可对大多数微控制器 (MCU) 基准电压进行精度调节。

在电流为 300mA 时,TPS7A25 LDO 的最大压降小于 340mV,因此它比标准线性稳压器的工作效率更高。此最大压降使得在 5.4V 输入电压 (V_{IN}) 至 5.0V 输出电压 (V_{OUT}) 范围内的效率达到了 92.5%。

电源正常状态 (PG) 指示灯可以用来将 MCU 保持在复位状态,直到电源正常,或用于电源定序。PG 引脚为开漏输出;因此,该引脚很容易进行电平位移,以便通过 V_{OUT} 以外的导轨进行监控。内置电流限制和热关断有助于在发生负载短路或故障时保护稳压器。

要获得更高的输出电流选项,请考虑 [TPS7A26](#)。

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision A (March 2019) to Revision B	Page
• 已更改 更改了输出电压选项 项目符号中的最大值：将固定电压从 5V 更改为 5.5V，并将可调节电压从 17.64V 更改为 17.66V	1
• 已更改 更改了“说明”部分：删除了第二段中的有关固定电压版本的描述，将 360mV 更改为 340mV，并添加了最后一段	1
• Added fixed version to <i>Pin Configuration and Functions</i> section	3
• Added accuracy for fixed output options	5
• 已添加 <i>Fixed Version</i> image to <i>Functional Block Diagrams</i> section	13
• 已添加 <i>Active</i> to <i>Active Overshoot Pulldown Circuitry</i> section title	15
• 已添加 <i>Fixed Version Layout Example</i> figure	23

Changes from Original (December 2018) to Revision A	Page
• 已更改 将状态由“预告信息”更改为“生产数据”	1

Pin Functions

NAME	PIN		I/O	DESCRIPTION
	DRV (Adjustable)	DRV (Fixed)		
EN	4	4	Input	Enable pin. Drive EN greater than $V_{EN(HI)}$ to enable the regulator. Drive EN less than $V_{EN(LOW)}$ to put the regulator into low-current shutdown. Do not float this pin. If not used, connect EN to IN.
FB	2	—	Input	Feedback pin. Input to the control-loop error amplifier. This pin is used to set the output voltage of the device with the use of external resistors. For adjustable-voltage version devices only.
GND	5	5	—	Ground pin.
IN	6	6	Input	Input pin. For best transient response and to minimize input impedance, use the recommended value or larger capacitor from IN to ground as listed in the Recommended Operating Conditions table. Place the input capacitor as close to the IN and GND pins of the device as possible.
NC	—	2	—	No internal connection. For fixed-voltage version devices only. This pin can be floated but the device will have better thermal performance with this pin tied to GND.
OUT	1	1	Output	Output pin. A capacitor is required from OUT to ground for stability. For best transient response, use the nominal recommended value or larger capacitor from OUT to ground. Follow the recommended capacitor value as listed in the Recommended Operating Conditions table. Place the output capacitor as close to the OUT and GND pins of the device as possible.
PG	3	3	Output	Power-good pin; open-collector output. Pullup externally to the OUT pin or another voltage rail. The PG pin goes high when $V_{OUT} > V_{IT(PG,RISING)}$ in the Electrical Characteristics table. The PG pin is driven low when $V_{OUT} < V_{IT(PG,FALLING)}$ in the Electrical Characteristics table. If not used this pin can be floated but the device will have better thermal performance with this pin tied to GND.
Thermal pad	Pad	Pad	—	Exposed pad of the package. Connect this pad to ground or leave floating. Connect the thermal pad to a large-area ground plane for best thermal performance.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage ⁽²⁾	V _{IN}	−0.3	20	V
	V _{OUT} ⁽³⁾	−0.3	V _{IN} + 0.3	
	V _{FB}	−0.3	5.5	
	V _{EN}	−0.3	20	
	V _{PG}	−0.3	20	
Current	Maximum output	Internally limited		A
Temperature	Operating junction, T _J	−50	150	°C
	Storage, T _{stg}	−65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages with respect to GND.
- (3) V_{IN} + 0.3 V or 20 V (whichever is smaller).

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 2-kV HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 500-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage	2.4		18	V
V _{OUT}	Output voltage (adjustable version)	1.24		18 - V _{DO}	V
V _{OUT}	Output voltage (fixed version)	1.25		5.5	V
I _{OUT}	Output current	0		300	mA
V _{EN}	Enable voltage	0		18	V
V _{PG} ⁽¹⁾	Power-good voltage	0		18	V
C _{IN} ⁽²⁾	Input capacitor		1		μF
C _{OUT} ⁽²⁾	Output capacitor	1	2.2	100	μF
T _J	Operating junction temperature	−40		125	°C

- (1) Select pullup resistor to limit PG pin sink current when PG output is driven low. See [Power Good](#) section for details.
- (2) All capacitor values are assumed to derate to 50% of the nominal capacitor value.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS7A25	UNIT
		DRV (WSON)	
		6 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	73.3	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	90.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	38.3	°C/W
ψ _{JT}	Junction-to-top characterization parameter	3.7	°C/W
ψ _{JB}	Junction-to-board characterization parameter	38.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	14.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

specified at $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or $V_{IN} = 2.4\text{ V}$ (whichever is greater), FB tied to OUT, $I_{OUT} = 1\text{ mA}$, $V_{EN} = 2\text{ V}$, and $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 2.2\text{ }\mu\text{F}$ ceramic (unless otherwise noted); typical values are at $T_J = 25^\circ\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{UVLO(RISING)}$	UVLO threshold rising	V_{IN} rising	1.95	2.15	2.35	V
$V_{UVLO(HYS)}$	UVLO hysteresis			70		mV
$V_{UVLO(FALLING)}$	UVLO threshold falling	V_{IN} falling	1.85	2.09	2.25	V
V_{FB}	Feedback voltage	Adjustable version only		1.24		V
V_{OUT}	Output voltage accuracy	Adjustable version, $V_{OUT} = V_{FB}$	1.228	1.24	1.252	V
V_{OUT}	Output voltage accuracy	Fixed output versions	–1		1	%
$\Delta V_{OUT(\Delta V_{IN})}$	Line regulation ⁽¹⁾	$(V_{OUT(nom)} + 0.5\text{ V or }2.4\text{ V}) \leq V_{IN} \leq 18\text{ V}$	–0.1		0.1	%
$\Delta V_{OUT(\Delta I_{OUT})}$	Load regulation	$1\text{ mA} \leq I_{OUT} \leq 300\text{ mA}$	–0.5		0.5	%
V_{DO}	Dropout voltage ⁽²⁾	$I_{OUT} = 50\text{ mA}$		64	105	mV
		$I_{OUT} = 150\text{ mA}$		120	180	
		$I_{OUT} = 300\text{ mA}$		210	340	
I_{CL}	Output current limit	$V_{OUT} = 0.9 \times V_{OUT(nom)}$	325	510	720	mA
I_{GND}	Ground pin current	$I_{OUT} = 0\text{ mA}$, $T_J = 25^\circ\text{C}$		2	4.5	μA
		$I_{OUT} = 1\text{ mA}$		15		
$I_{SHUTDOWN}$	Shutdown current	$V_{EN} \leq 0.4\text{ V}$, $V_{IN} = 2.4\text{ V}$, $I_{OUT} = 0\text{ mA}$		325	600	nA
I_{FB}	FB pin current			10		nA
I_{EN}	EN pin current	$V_{EN} = 18\text{ V}$		10		nA
$V_{EN(HI)}$	Enable pin high-level input voltage	Device enabled	0.9			V
$V_{EN(LOW)}$	Enable pin low-level input voltage	Device disabled			0.4	V
$V_{IT(PG,RISING)}$	PG pin threshold rising	$R_{PULLUP} = 10\text{ k}\Omega$, V_{OUT} rising, $V_{IN} \geq V_{UVLO(RISING)}$		93	96.5	$\%V_{OUT}$
$V_{HYS(PG)}$	PG pin hysteresis	$R_{PULLUP} = 10\text{ k}\Omega$, V_{OUT} falling, $V_{IN} \geq V_{UVLO(RISING)}$		3		$\%V_{OUT}$
$V_{IT(PG,FALLING)}$	PG pin threshold falling	$R_{PULLUP} = 10\text{ k}\Omega$, V_{OUT} falling, $V_{IN} \geq V_{UVLO(RISING)}$	84	90		$\%V_{OUT}$
$V_{OL(PG)}$	PG pin low level output voltage	$V_{OUT} < V_{IT(PG,FALLING)}$, $I_{PG-SINK} = 500\text{ }\mu\text{A}$			0.4	V
$I_{LKG(PG)}$	PG pin leakage current	$V_{OUT} > V_{IT(PG,RISING)}$, $V_{PG} = 18\text{ V}$		5	300	nA
PSRR	Power-supply rejection ratio	$f = 10\text{ Hz}$		75		dB
		$f = 100\text{ Hz}$		62		
		$f = 1\text{ kHz}$		52		
V_n	Output noise voltage	$BW = 10\text{ Hz to }100\text{ kHz}$, $V_{OUT} = 1.2\text{ V}$		300		μV_{RMS}
$T_{SD(shutdown)}$	Thermal shutdown temperature	Shutdown, temperature increasing		165		$^\circ\text{C}$
$T_{SD(reset)}$	Thermal shutdown reset temperature	Reset, temperature decreasing		145		$^\circ\text{C}$

(1) $V_{out(nom)} + 0.5\text{ V}$ or 2.4 V (whichever is greater).

(2) V_{DO} is measured with $V_{IN} = 0.97 \times V_{OUT(nom)}$ for fixed output voltage versions. V_{DO} is not measured for fixed output voltage versions when $V_{OUT} \leq 2.5\text{ V}$. For the adjustable output device, V_{DO} is measured with $V_{FB} = 0.97 \times V_{FB(nom)}$.

6.6 Typical Characteristics

at operating temperature $T_J = 25^\circ\text{C}$, $I_{OUT} = 1\text{ mA}$, $V_{EN} = 0.9\text{ V}$, $C_{IN} = 2.2\text{ }\mu\text{F}$, $C_{OUT} = 2.2\text{ }\mu\text{F}$, and $V_{IN} = V_{OUT(yp)} + 0.5\text{ V}$ or 2.4 V (whichever is greater), unless otherwise noted; typical values are at $T_J = 25^\circ\text{C}$

7 Detailed Description

7.1 Overview

The TPS7A25 is an 18-V, low quiescent current, low-dropout (LDO) linear regulator. The low I_Q performance makes the TPS7A25 an excellent choice for battery-powered or line-power applications that are expected to meet increasingly stringent standby-power standards.

The 1% accuracy over temperature and power-good indication make this device an excellent choice for meeting a wide range of microcontroller power requirements. Additionally, the TPS7A25 has an internal soft-start to minimize inrush current into the output capacitance.

For increased reliability, the TPS7A25 also incorporates overcurrent, overshoot pulldown, and thermal shutdown protection. The operating junction temperature is -40°C to $+125^{\circ}\text{C}$, and adds margin for applications concerned with higher working ambient temperatures.

The TPS7A25 is available in a thermally enhanced WSON package.

7.2 Functional Block Diagrams

图 34. Adjustable Version

Functional Block Diagrams (continued)

图 35. Fixed Version

7.3 Feature Description

7.3.1 Output Enable

The enable pin for the device is an active-high pin. The output voltage is enabled when the voltage of the enable pin is greater than the high-level input voltage of the EN pin and disabled with the enable pin voltage is less than the low-level input voltage of the EN pin. If independent control of the output voltage is not needed, connect the enable pin to the input of the device.

7.3.2 Dropout Voltage

Dropout voltage (V_{DO}) is defined as the input voltage minus the output voltage ($V_{IN} - V_{OUT}$) at the rated output current (I_{RATED}), where the pass transistor is fully on. I_{RATED} is the maximum I_{OUT} listed in the *Recommended Operating Conditions* table. The pass transistor is in the ohmic or triode region of operation, and acts as a switch. The dropout voltage indirectly specifies a minimum input voltage greater than the nominal programmed output voltage at which the output voltage is expected to stay in regulation. If the input voltage falls to less than the nominal output regulation, then the output voltage falls as well.

Feature Description (continued)

For a CMOS regulator, the dropout voltage is determined by the drain-source on-state resistance ($R_{DS(ON)}$) of the pass transistor. Therefore, if the linear regulator operates at less than the rated current, the dropout voltage for that current scales accordingly. Use [Equation 1](#) to calculate the $R_{DS(ON)}$ of the device.

$$R_{DS(ON)} = \frac{V_{DO}}{I_{RATED}} \quad (1)$$

7.3.3 Current Limit

The device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a brickwall scheme. In a high-load current fault, the brickwall scheme limits the output current to the current limit (I_{CL}). I_{CL} is listed in the *Electrical Characteristics* table.

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brickwall current limit, the pass transistor dissipates power $[(V_{IN} - V_{OUT}) \times I_{CL}]$. If thermal shutdown is triggered, the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits application report](#).

[Figure 36](#) shows a diagram of the current limit.

Figure 36. Current Limit

7.3.4 Undervoltage Lockout (UVLO)

The device has an independent undervoltage lockout (UVLO) circuit that monitors the input voltage, allowing a controlled and consistent turn on and off of the output voltage. To prevent the device from turning off if the input drops during turn on, the UVLO has hysteresis as specified in the *Electrical Characteristics* table.

7.3.5 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when the junction temperature (T_J) of the pass transistor rises to $T_{SD(shutdown)}$ (typical). Thermal shutdown hysteresis assures that the device resets (turns on) when the temperature falls to $T_{SD(reset)}$ (typical).

The thermal time-constant of the semiconductor die is fairly short, thus the device may cycle on and off when thermal shutdown is reached until power dissipation is reduced. Power dissipation during startup can be high from large $V_{IN} - V_{OUT}$ voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before startup completes.

Feature Description (continued)

When the thermal limit is triggered with the load current near the value of the current limit, the output may oscillate prior to the output switching off.

For reliable operation, limit the junction temperature to the maximum listed in the *Recommended Operating Conditions* table. Operation above this maximum temperature causes the device to exceed its operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overall conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above the maximum recommended junction temperature reduces long-term reliability.

7.3.6 Power Good

The power-good (PG) pin is an open-drain output and can be connected to a regulated supply through an external pullup resistor. The maximum pullup voltage is listed as V_{PG} in the *Recommended Operating Conditions* table. For the PG pin to have a valid output, the voltage on the IN pin must be greater than $V_{UVLO(RISING)}$, as listed in the *Electrical Characteristics* table. When the V_{OUT} exceeds $V_{IT(PG,RISING)}$, the PG output is high impedance and the PG pin voltage pulls up to the connected regulated supply. When the regulated output falls below $V_{IT(PG,FALLING)}$, the open-drain output turns on and pulls the PG output low after a short deglitch time. If output voltage monitoring is not needed, the PG pin can be left floating or connected to ground.

The recommended maximum PG pin sink current ($I_{PG-SINK}$) and the leakage current into the PG pin ($I_{LKG(PG)}$) are listed in the *Electrical Characteristics* table.

The PG pullup voltage (V_{PG_PULLUP}), the desired minimum power-good output voltage ($V_{PG(MIN)}$), and $I_{LKG(PG)}$ limit the maximum PG pin pullup resistor value (R_{PG_PULLUP}). V_{PG_PULLUP} , the PG pin low-level output voltage ($V_{OL(PG)}$), and $I_{PG-SINK}$ limit the minimum R_{PG_PULLUP} . Maximum and minimum values for R_{PG_PULLUP} can be calculated from the following equations:

$$R_{PG_PULLUP(MAX)} = (V_{PG_PULLUP} - V_{PG(MIN)}) / I_{LKG(PG)_MAX} \quad (2)$$

$$R_{PG_PULLUP(MIN)} = (V_{PG_PULLUP} - V_{OL(PG)}) / I_{PG-SINK} \quad (3)$$

For example, if the PG pin is connected to a pullup resistor with a 3.3-V external supply, from [Equation 2](#), $R_{PG_PULLUP(MAX)}$ is 11 MΩ. From [Equation 3](#), $R_{PG_PULLUP(MIN)}$ is 5.8 kΩ.

7.3.7 Active Overshoot Pulldown Circuitry

This device has pulldown circuitry connected to V_{OUT} . This circuitry is a 100-μA current sink, in series with a 5.5-kΩ resistor, controlled by V_{EN} . When V_{EN} is below $V_{EN(LOW)}$, the pulldown circuitry is disabled and the LDO output is in high-impedance mode.

If the output voltage is more than 60 mV above nominal voltage when $V_{EN} \geq V_{EN(LOW)}$, the pulldown circuitry turns on and the output is pulled down until the output voltage is within 60 mV from the nominal voltage. This feature helps reduce overshoot during the transient response.

7.4 Device Functional Modes

7.4.1 Device Functional Mode Comparison

The *Device Functional Mode Comparison* table shows the conditions that lead to the different modes of operation. See the *Electrical Characteristics* table for parameter values.

Table 1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal operation	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > V_{IN(min)}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Dropout operation	$V_{IN(min)} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Disabled (any true condition disables the device)	$V_{IN} < V_{UVLO}$	$V_{EN} < V_{EN(LOW)}$	Not applicable	$T_J > T_{SD(shutdown)}$

7.4.2 Normal Operation

The device regulates to the nominal output voltage when the following conditions are met:

- The input voltage is greater than the nominal output voltage plus the dropout voltage ($V_{OUT(nom)} + V_{DO}$)
- The output current is less than the current limit ($I_{OUT} < I_{CL}$)
- The device junction temperature is less than the thermal shutdown temperature ($T_J < T_{SD}$)
- The enable voltage has previously exceeded the enable rising threshold voltage and has not yet decreased to less than the enable falling threshold

7.4.3 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode, the output voltage tracks the input voltage. During this mode, the transient performance of the device becomes significantly degraded because the pass transistor is in the ohmic or triode region, and acts as a switch. Line or load transients in dropout can result in large output-voltage deviations.

When the device is in a steady dropout state (defined as when the device is in dropout, $V_{IN} < V_{OUT(NOM)} + V_{DO}$, directly after being in a normal regulation state, but *not* during startup), the pass transistor is driven into the ohmic or triode region. When the input voltage returns to a value greater than or equal to the nominal output voltage plus the dropout voltage ($V_{OUT(NOM)} + V_{DO}$), the output voltage can overshoot for a short period of time while the device pulls the pass transistor back into the linear region.

7.4.4 Disabled

The output of the device can be shutdown by forcing the voltage of the enable pin to less than the maximum EN pin low-level input voltage (see the *Electrical Characteristics* table). When disabled, the pass transistor is turned off and internal circuits are shutdown.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Adjustable Device Feedback Resistors

The adjustable-version device requires external feedback divider resistors to set the output voltage. V_{OUT} is set using the feedback divider resistors, R_1 and R_2 , according to the following equation:

$$V_{OUT} = V_{FB} \times (1 + R_1 / R_2) \quad (4)$$

To ignore the FB pin current error term in the V_{OUT} equation, set the feedback divider current to 100x the FB pin current listed in the *Electrical Characteristics* table. This setting provides the maximum feedback divider series resistance, as shown in the following equation:

$$R_1 + R_2 \leq V_{OUT} / (I_{FB} \times 100) \quad (5)$$

8.1.2 Recommended Capacitor Types

The device is designed to be stable using low equivalent series resistance (ESR) capacitors at the input and output. Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and C0G-rated dielectric materials provide relatively good capacitive stability across temperature, whereas the use of Y5V-rated capacitors is discouraged because of large variations in capacitance.

Regardless of the ceramic capacitor type selected, the effective capacitance varies with operating voltage and temperature. As a rule of thumb, expect the effective capacitance to decrease by as much as 50%. The input and output capacitors recommended in the *Recommended Operating Conditions* table account for an effective capacitance of approximately 50% of the nominal value.

8.1.3 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability, good analog design practice is to connect a capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. An input capacitor is recommended if the source impedance is more than 0.5 Ω . A higher value capacitor may be necessary if large, fast transient load or line transients are anticipated or if the device is located several inches from the input power source.

Dynamic performance of the device is improved with the use of an output capacitor. Use an output capacitor within the range specified in the *Recommended Operating Conditions* table for stability.

The effective output capacitance is recommended to not exceed 50 μ F.

8.1.4 Reverse Current

Excessive reverse current can damage this device. Reverse current flows through the intrinsic body diode of the pass transistor instead of the normal conducting channel. At high magnitudes, this current flow degrades the long-term reliability of the device.

Conditions where reverse current can occur are outlined in this section, all of which can exceed the absolute maximum rating of $V_{OUT} \leq V_{IN} + 0.3$ V.

- If the device has a large C_{OUT} and the input supply collapses with little or no load current
- The output is biased when the input supply is not established
- The output is biased above the input supply

Application Information (continued)

If reverse current flow is expected in the application, external protection is recommended to protect the device. Reverse current is not limited in the device, so external limiting is required if extended reverse voltage operation is anticipated.

Figure 37 shows one approach for protecting the device.

Figure 37. Example Circuit for Reverse Current Protection Using a Schottky Diode

Figure 38 shows another, more commonly used, approach in high input voltage applications.

Figure 38. Reverse Current Prevention Using A Diode Before the LDO

8.1.5 Feed-Forward Capacitor (C_{FF})

For the adjustable-voltage version device, a feed-forward capacitor (C_{FF}) can be connected from the OUT pin to the FB pin. C_{FF} improves transient, noise, and PSRR performance, but is not required for regulator stability. Recommended C_{FF} values are listed in the *Recommended Operating Conditions* table. A higher capacitance C_{FF} can be used; however, the startup time increases. For a detailed description of C_{FF} tradeoffs, see the [Pros and Cons of Using a Feedforward Capacitor with a Low-Dropout Regulator](#) application report.

8.1.6 Power Dissipation (P_D)

Circuit reliability requires consideration of the device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must have few or no other heat-generating devices that cause added thermal stress.

To first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. Equation 6 calculates power dissipation (P_D).

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (6)$$

NOTE

Power dissipation can be minimized, and therefore greater efficiency can be achieved, by correct selection of the system voltage rails. For the lowest power dissipation use the minimum input voltage required for correct output regulation.

For devices with a thermal pad, the primary heat conduction path for the device package is through the thermal pad to the PCB. Solder the thermal pad to a copper pad area under the device. This pad area must contain an array of plated vias that conduct heat to additional copper planes for increased heat dissipation.

Application Information (continued)

The maximum power dissipation determines the maximum allowable ambient temperature (T_A) for the device. According to [Equation 7](#), power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A).

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (7)$$

Thermal resistance ($R_{\theta JA}$) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The junction-to-ambient thermal resistance listed in the *Thermal Information* table is determined by the JEDEC standard PCB and copper-spreading area, and is used as a relative measure of package thermal performance.

8.1.7 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the linear regulator when in-circuit on a typical PCB board application. These metrics are not thermal resistance parameters and instead offer a practical and relative way to estimate junction temperature. These psi metrics are determined to be significantly independent of the copper area available for heat-spreading. The *Thermal Information* table lists the primary thermal metrics, which are the junction-to-top characterization parameter (ψ_{JT}) and junction-to-board characterization parameter (ψ_{JB}). These parameters provide two methods for calculating the junction temperature (T_J). As described in , use the junction-to-top characterization parameter (ψ_{JT}) with the temperature at the center-top of device package (T_T) to calculate the junction temperature. As described in , use the junction-to-board characterization parameter (ψ_{JB}) with the PCB surface temperature 1 mm from the device package (T_B) to calculate the junction temperature.

$$T_J = T_T + \psi_{JT} \times P_D$$

where:

- P_D is the dissipated power
- T_T is the temperature at the center-top of the device package

$$T_J = T_B + \psi_{JB} \times P_D$$

where

- T_B is the PCB surface temperature measured 1 mm from the device package and centered on the package edge

For detailed information on the thermal metrics and how to use them, see the [Semiconductor and IC Package Thermal Metrics application report](#).

Application Information (continued)

8.1.8 Special Consideration for Line Transients

During a line transient, the response of this LDO to a very large or fast input voltage change can cause a brief shutdown lasting up to a few hundred microseconds from the voltage transition. This shutdown can be avoided by reducing the voltage step size, increasing the transition time, or a combination of both. 图 39 provides a boundary to follow to avoid this behavior. If necessary, reduce slew rate and the voltage step size to stay below the curve.

图 39. Recommended Input Voltage Step and Slew Rate in a Line transient

8.2 Typical Application

图 40. Generating a 5-V Rail From a Multicell Power Bank

8.2.1 Design Requirements

表 2 summarizes the design requirements for 图 40.

表 2. Design Parameters

PARAMETER	DESIGN VALUES
V_{IN}	8.4 V
V_{OUT}	5 V $\pm 1\%$
I_{IN} (no load)	< 5 μA
I_{OUT} (max)	220 mA
T_A	70°C (max)

8.2.2 Detailed Design Procedure

Select a 5-V output, fixed or adjustable device to generate the 5-V rail. The fixed-version LDO has internal feedback divider resistors and thus has lower effective quiescent current. The adjustable-version LDO requires external feedback divider resistors, and resistor selection is described in the [Selecting Feedback Divider Resistors](#) section.

8.2.2.1 Transient Response

As with any regulator, increasing the output capacitor value reduces over- and undershoot magnitude, but increases transient response duration.

8.2.2.2 Selecting Feedback Divider Resistors

For this design example, V_{OUT} is set to 5 V. The following equations set the feedback divider resistors for the desired output voltage:

$$V_{OUT} = V_{FB} \times (1 + R_1 / R_2) \quad (10)$$

$$R_1 + R_2 \leq V_{OUT} / (I_{FB} \times 100) \quad (11)$$

For improved output accuracy, use [Equation 11](#) and $I_{FB(TYP)} = 10$ nA as listed in the [Electrical Characteristics](#) table to calculate the upper limit for series feedback resistance, $R_1 + R_2 \leq 5$ M Ω .

The control-loop error amplifier drives the FB pin to the same voltage as the internal reference ($V_{FB} = 1.24$ V as listed in the [Electrical Characteristics](#) table). Use [Equation 10](#) to determine the ratio of $R_1 / R_2 = 3.03$. Use this ratio and solve [Equation 11](#) for R_2 . Now calculate the upper limit for $R_2 \leq 1.24$ M Ω . Select a standard resistor value for $R_2 = 1.18$ M Ω .

Reference [Equation 10](#) and solve for R_1 :

$$R_1 = (V_{OUT} / V_{FB} - 1) \times R_2 \quad (12)$$

From [公式 12](#), $R_1 = 3.64$ M Ω can be determined. Select a standard resistor value for $R_1 = 3.6$ M Ω . From [Equation 10](#), $V_{OUT} = 5.023$ V.

8.2.2.3 Thermal Dissipation

Junction temperature can be determined using the junction-to-ambient thermal resistance ($R_{\theta JA}$) and the total power dissipation (P_D). Use [公式 13](#) to calculate the power dissipation. Multiply P_D by $R_{\theta JA}$ and add the ambient temperature (T_A), as [公式 14](#) shows, to calculate the junction temperature (T_J).

$$P_D = (I_{GND} + I_{OUT}) \times (V_{IN} - V_{OUT}) \quad (13)$$

$$T_J = R_{\theta JA} \times P_D + T_A \quad (14)$$

[公式 15](#) calculates the maximum ambient temperature. [公式 16](#) calculates the maximum ambient temperature for this application.

$$T_{A(MAX)} = T_{J(MAX)} - (R_{\theta JA} \times P_D) \quad (15)$$

$$T_{A(MAX)} = 125^\circ\text{C} - [73.3^\circ\text{C/W} \times (8.4 \text{ V} - 5 \text{ V}) \times 0.22 \text{ A}] = 70.2^\circ\text{C} \quad (16)$$

8.2.3 Application Curve

$I_{OUT} = 1 \text{ mA to } 0.22 \text{ A}$, slew rate = $0.5 \text{ A}/\mu\text{s}$,
 $V_{OUT} = 5 \text{ V}$, $V_{IN} = 8.4 \text{ V}$, $C_{IN} = 1 \mu\text{F}$, $C_{OUT} = 1 \mu\text{F}$, $C_{FF} = 0 \mu\text{F}$

图 41. TPS7A25 Load Transient (1 mA to 220 mA)

9 Power Supply Recommendations

The device is designed to operate from an input supply voltage range of 2.4 V to 18 V. To ensure that the output voltage is well regulated and dynamic performance is optimum, the input supply must be at least $V_{OUT(nom)} + 0.5$ V. Connect a low output impedance power supply directly to the input pin of the TPS7A25.

10 Layout

10.1 Layout Guidelines

- Place input and output capacitors as close to the device pins as possible
- Use copper planes for device connections to optimize thermal performance
- Place thermal vias around the device and under the DRV thermal pad to distribute heat

10.2 Layout Examples

图 42. Adjustable Version Layout Example

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
