This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) Stresses above those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute maximum rated conditions for extended periods may degrade device reliability.

- (2) TX517 CW outputs are complimentary. Thus a transformer is needed to enable CW output.
- (3) Input gate charge is the amount of charge to change the internal FET gates of a given output from either a low to a high state or from a high to a low state. Each gate charge value applies to both the P and N type FET for the given output. These values can be used to estimate the amount of dynamic current that needs to be provided to the VDD and VEE power supplies in order to switch the internal FET's at a given sampling rate.

APPLICATION INFORMATION

Table 1. Truth Table

Latch Mode	0	1	0/1	0	0	0/1	0/1

- (1) The logic device driving the inputs of the TX517 should include means to prevent a 'shoot-thru' fault condition. Any input combination that would result in an INP-input to be Low (0) and an INN-input to be High (1) at the same time on the same output (OUTA or OUTB) could result in permanent damage to the TX517. See also disallowed logic state table. [Table 3](#) is provided for an example of how to properly drive the TX517 data inputs INPxx and INNxx.
- (2) X = don't care state. However, in order to prevent excessive power consumption it is recommended that all unused inputs be tied off to a logic high or logic low. The logic inputs to the device have no internal tie-off's.

Disallowed mode 7 ⁽³⁾	0	x	0	x	x	x	x	x	x

- (1) This logic state causes a 'shoot-thru' fault condition that could result in permanent damage to the TX517.
- (2) This logic state causes a high power consumption condition in the internal logic circuitry of the TX517 and could result in a long term reliability failure of the TX517.
- (3) This disallowed logic state is only valid for DC conditions. i.e. it is not allowed to keep PCLKIN at a low logic state when EN is at a low logic state. This causes a high power consumption condition in the internal logic circuitry of the TX517. However, it is acceptable to drive EN low and drive PCLKIN with a clock waveform under the recommended operating conditions for PCLKIN.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
