

DS125BR401 具有输入均衡 和输出去加重功能的低功耗 12.5Gbps 4 通道中继器

1 特性

- 综合型器件系列，具有经实践检验的系统互操作性
 - DS125BR111：单通道中继器
 - DS125BR401：四通道中继器
 - DS125BR800：八通道中继器
 - DS125MB203：双端口 2:1/1:2 多路复用器/开关
 - DS125DF410：支持时钟和数据恢复 (CDR) 的四通道单向重定时器
- 低功耗：每通道 65mW（典型值），可选择关闭不使用的通道
- 支持 PCIe“非限制性”输出和 10G-KR 链路协商
- 高级信号调节功能
 - 6.25GHz 时，支持高达 30dB 的接收均衡功能
 - 发送去加重功能高达 -12dB
 - 发送输出电压控制：700mV 至 1300mV
- 可通过引脚选择、EEPROM 或 SMBus 接口进行编程
- 单电源电压：2.5V 或 3.3V（可选）
- 40°C 至 85°C 的工作温度范围
- 5kV 人体放电模式 (HBM) 静电放电 (ESD) 额定电压
- 直通引脚分配：10mm × 5.5mm 54 引脚超薄型四方扁平无引线 (WQFN) 封装
- 支持的协议
 - sRIO, Infiniband, Interlaken, 通用公共无线接口 (CPRI), 开放基站架构协议 (OBSAI)
 - 其它私有接口高达 12.5Gbps

2 应用范围

- SAS/SATA（高达 6Gbps），光纤通道（高达 10GFC）
- PCIe 1 代/2 代/3 代、10G-KR、10GbE、XAUI、RXAUI

3 说明

DS125BR401 器件是一款超低功耗高性能多协议中继器和转接驱动器，专用于支持速率高达 12.5Gbps 的四通道 PCIe 1 代/2 代/3 代、10G-KR 以及其他高速接口串行协议。接收器的连续时间线性均衡器 (CTLE) 可在 6.25GHz (12.5Gbps) 时为八个通道分别提供高达 30dB 的增强性能，能够打开一个因码间干扰 (ISI)（由 30 英寸以上的背板走线或 8 米以上铜缆等互连介质引起）而完全关闭的输入眼型状态，从而通过主机控制器确保实现无错误的端到端链接。发送器提供高达 -12dB 的去加重增强以及 700mV 至 1300mV 的输出电压幅度控制，以便在互连通道内的实体布局方面实现最大限度的灵活性。

6 说明 (续)

在 10G-KR 和 PCIe 3 代模式下运行时，DS125BR401 允许主机控制器和端点优化完整链路并协商发射均衡器系数。这个链路协商协议的透明管理可以最短延迟扩展最大通道损耗。DS125BR401 采用节能系统设计，每通道的功耗低至 65mW（典型值），可选择关闭不使用的通道。需要一个 3.3V 或 2.5V 的单电源来为此器件供电。

可通过引脚、软件（SMBus 或 I²C）轻松应用该可编程设置，或者通过外部 EEPROM 载入此设置。当运行在 EEPROM 模式下时，配置信息在加电时自动载入，这样就免除了对于外部微控制器或软件驱动程序的需要。

CONTROL PINS — SHARED (LVCMOS)			
ENSMB	48	I, 4-LEVEL, LVCMOS	System Management Bus (SMBus) Enable pin Tie 1 kΩ to VDD = Register Access SMBus Slave mode FLOAT = Read External EEPROM (Master SMBUS Mode) Tie 1 kΩ to GND = Pin Mode
ENSMB = 1 (SMBUS MODE)			
SCL	50	I, 2-LEVEL, LVCMOS, O, OPEN Drain	ENSMB Master or Slave mode SMBUS clock input pin is enabled (slave mode). Clock output when loading EEPROM configuration (master mode).
SDA	49	I, 2-LEVEL, LVCMOS, O, OPEN Drain	ENSMB Master or Slave mode The SMBus bidirectional SDA pin is enabled. Data input or open-drain (pulldown only) output.
AD0-AD3	54, 53, 47, 46	I, 4-LEVEL, LVCMOS	ENSMB Master or Slave mode SMBus Slave Address Inputs. In SMBus mode, these pins are the user set SMBus slave address inputs. There are 16 addresses supported by these pins. Pins must be tied LOW or HIGH when used to define the device SMBus address.
READ_EN	26	I, 2-LEVEL, LVCMOS	When using an External EEPROM, a transition from high to low starts the load from the external EEPROM
ENSMB = 0 (PIN MODE)			
EQA0, EQA1 EQB0, EQB1	20, 19 46, 47	I, 4-LEVEL, LVCMOS	EQA[1:0] and EQB[1:0] control the level of equalization of the A/B sides as shown in . The pins are active only when ENSMB is deasserted (low). Each of the 4 A/B channels have the same level unless controlled by the SMBus control registers. When ENSMB goes high the SMBus registers provide independent control of each lane. The EQB[1:0] pins are converted to SMBUS AD2, AD3 inputs. See Table 2 .
DEMA0, DEMA1 DEMB0, DEMB1	49, 50 53, 54	I, 4-LEVEL, LVCMOS	DEMA[1:0] and DEMB[1:0] control the level of de-emphasis of the A/B sides as shown in . The pins are only active when ENSMB is deasserted (low). Each of the 4 A/B channels have the same level unless controlled by the SMBus control registers. When ENSMB goes high the SMBus registers provide independent control of each lane. The DEMA[1:0] pins are converted to SMBUS SCL/SDA and DEMB[1:0] pins are converted to AD0, AD1 inputs. See Table 3 .

- (1) LVCMOS inputs without the “Float” conditions must be driven to a logic low or high at all times or operation is not ensured.
 Input edge rate for LVCMOS/FLOAT inputs must be faster than 50 ns from 10–90%.
 For 3.3-V mode operation, VIN pin = 3.3 V and the VDD for the 4-level input is 3.3 V.
 For 2.5-V mode operation, VDD pin = 2.5 V and the VDD for the 4-level input is 2.5 V.

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- (2) For soldering specifications: See application note [SNOA549](#).

8.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±5000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±1000	
		Machine model (MM), JESD22-A115-A	±150	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

The *Recommended Operating Conditions* indicate conditions at which the device is functional and the device should not be operated beyond such conditions. Absolute maximum numbers are specified for a junction temperature range of –40°C to 125°C. Models are validated to maximum operating voltages only.

	MIN	NOM	MAX	UNIT

(1) In PCIe Gen-3 mode, the output VOD level is not fixed. It will be adjusted automatically based on the VID input amplitude level. The output VOD level set by DEMA/B[1:0] in this MODE is dependent on the VID level and the frequency content. The DS125BR401 repeater is designed to be nonlimiting in this MODE, so the TX-FIR (de-emphasis) is passed to the RX to support the handshake negotiation link training.

9 Detailed Description

9.1 Overview

The DS125BR401 device compensates for lossy printed-circuit-board (PCB) backplanes and balanced cables.

The DS125BR401 compensates for lossy FR-4 PCB backplanes and balanced cables. The DS125BR401 operates in 3 modes: Pin Control Mode (ENSMB = 0), SMBus Slave Mode (ENSMB = 1) and SMBus Master Mode (ENSMB = float) to load register informations from external EEPROM; refer to [SMBus Master Mode](#) for additional information.

9.2 Functional Block Diagram

Figure 8. Block Diagram - Detail View Of Channel (1 Of 8)

9.3 Feature Description

The 4-level input pins use a resistor divider to help set the 4 valid levels and provide a wider range of control settings when ENSMB=0. There is an internal 30-kΩ pullup and a 60-kΩ pulldown connected to the package pin. These resistors, together with the external resistor connection combine to achieve the desired voltage level. Using the 1-kΩ pullup, 1-kΩ pulldown, no connect, and 20-kΩ pulldown provide the optimal voltage levels for each of the four input states.

Table 1. 4-Level Control Pin Settings

LEVEL	SETTING	3.3-V MODE	2.5-V MODE
0	Tie 1 kΩ to GND	0.10 V	0.08 V
R	Tie 20 kΩ to GND	$\frac{1}{3} \times V_{IN}$	$\frac{1}{3} \times V_{DD}$
Float	Float (leave pin open)	$\frac{2}{3} \times V_{IN}$	$\frac{2}{3} \times V_{DD}$
1	Tie 1 kΩ to V_{IN} or V_{DD}	$V_{IN} - 0.05 \text{ V}$	$V_{DD} - 0.04 \text{ V}$

9.3.1 Typical 4-Level Input Thresholds

- Level 1 - 2 = $0.2 \times V_{IN}$ or V_{DD}
- Level 2 - 3 = $0.5 \times V_{IN}$ or V_{DD}
- Level 3 - 4 = $0.8 \times V_{IN}$ or V_{DD}

To minimize the start-up current associated with the integrated 2.5-V regulator, TI recommends using the 1-kΩ pullup and pulldown resistors. If several 4-level inputs require the same setting, it is possible to combine two or more 1-kΩ resistors into a single lower value resistor. As an example; combining two inputs with a single 500-Ω resistor is a good way to save board space.

9.4 Device Functional Modes

9.4.1 Pin Control Mode

When in pin mode (ENSMB = 0), equalization and de-emphasis can be selected through pin for each side independently. When de-emphasis is asserted VOD is automatically adjusted per [Table 3](#). For PCIe applications, the RXDET pins provides automatic and manual control for input termination (50 Ω or >50 k Ω). MODE setting is also pin controllable with pin selections (PCIe Gen-1, PCIe Gen-2, auto detect, and PCIe Gen-3). The receiver electrical idle detect threshold is also adjustable through the SD_TH pin.

9.4.2 SMBUS Mode

When in SMBus mode (ENSMB = 1), the VOD (output amplitude), equalization, de-emphasis, and termination disable features are all programmable on a individual lane basis, instead of grouped by A or B as in the pin mode case. Upon assertion of ENSMB, the EQx and DEMx functions revert to register control immediately. The EQx and DEMx pins are converted to AD0-AD3 SMBus address inputs. The other external control pins (MODE, RXDET and SD_TH) remain active unless their respective registers are written to and the appropriate override bit is set, in which case they are ignored until ENSMB is driven low (pin mode). On power up and when ENSMB is driven low all registers are reset to their default state. If PWDN is asserted while ENSMB is high, the registers retain their current state.

Equalization settings accessible through the pin controls were chosen to meet the needs of most high speed applications. If additional fine tuning or adjustment is needed, additional equalization settings can be accessed through the SMBus registers. Each input has a total of 256 possible equalization settings. [System Management Bus \(SMBus\) and Configuration Registers](#) show the 16 setting when the device is in pin mode. When using SMBus mode, the equalization, VOD and de-emphasis levels are set by registers.

9.5 Programming

9.5.1 PCIe Signal Integrity

When using the DS125BR401 in PCIe Gen-3 systems, there are specific signal integrity settings to ensure signal integrity margin. The settings were optimized by extensive testing. Contact your field representative for more information regarding the testing completed to achieve these settings.

For tuning the in the downstream direction (from CPU to EP).

- EQ: use the guidelines outlined in [Table 2](#).
- De-Emphasis: use the guidelines outlined in [Table 3](#).
- VOD: use the guidelines outlined in [Table 3](#).

For tuning in the upstream direction (from EP to CPU).

- EQ: use the guidelines outlined in [Table 2](#).
- De-Emphasis:
 - For trace lengths < 15 in set to –3.5 dB
 - For trace lengths > 15 in set to –6 dB
- VOD: set to 900 mV

9.5.1.1 RX-Detect in SAS/SATA (up to 6 Gbps) Applications

Unlike PCIe systems, SAS/SATA (up to 6 Gbps) systems use a low speed Out-Of-Band or OOB communications sequence to detect and communicate between Controllers/Expanders and target drives. This communication eliminates the need to detect for endpoints like PCIe. For SAS/SATA systems, TI recommends tying the RXDET pin high. This will ensure any OOB sequences sent from the Controller/Expander will reach the target drive without any additional latency due to the termination detection sequence defined by PCIe.

1	11	190 mVp-p	130 mVp-p

(1) VDD = 2.5V, 25°C and 0101 pattern at 8 Gbps

9.5.1.1.1 Signal Detect Control for Datarates Above 8 Gbps

Signal detect bandwidth limitations combined with high levels of signal attenuation can result in intermittent data loss above 8 Gbps. This data loss can be eliminated by disabling automatic detection and forcing the Signal Detect function to be always "on". This programming requires SMBus control over the DS125BR401 to be present. The Signal Detect function is controlled for each channel independently. The register programming sequence is shown below:

1. Write register 0x06 = 0x18 /* Enable SMBus register programming
2. Write registers 0x0D[1] = 1'b, 0x14[1] = 1'b, 0x1B[1] = 1'b, 0x22[1] = 1'b /* CH0 - CH3
3. Write registers 0x2A[1] = 1'b, 0x31[1] = 1'b, 0x38[1] = 1'b, 0x3F[1] = 1'b /* CH4 - CH7

Table 6. MODE Operation with Pin Control

MODE (PIN 21)	Driver Characteristics	PCIe	SAS SATA	10G-KR	10GbE	CPRI OBSAI	SRIO (R)XAUI	Interlaken Infiniband
0	Limiting		X		X	X	X	X
R	Nonlimiting without DE							
F (default)	Automatic	X						
1	Nonlimiting with DE			X				

Note: Automatic operation allows input to sense the incoming data rate and use a Nonlimiting output driver for operation at or above 8 Gbps.

Note: SAS/SATA up to 6 Gbps.

9.5.1.2 MODE Operation With SMBus Registers

When in SMBus mode (Slave or Master), the MODE pin retains control of the output driver characteristics. In order to override this control function, Register 0x08[2] must be written with a "1". Writing this bit enables MODE control of each channel individually using the channel registers defined in [Table 7](#).

Note: CRC_EN = 0, Address Map = 1, >256 byte = 0, Device Count[3:0] = 3. This example has all eight channels set to EQ = 00 (min boost), VOD = 1 V, DEM = 0 (0 dB) and multiple device can point to the same address map. Maximum EEPROM size is 8Kb (1024 × 8 bits).

9.5.3 System Management Bus (SMBus) and Configuration Registers

The System Management Bus interface is compatible to SMBus 2.0 physical layer specification. ENSMB = 1 kΩ to VDD to enable SMBus slave mode and allow access to the configuration registers.

The DS125BR401 has the AD[3:0] inputs in SMBus mode. These pins are the user set SMBUS slave address inputs. The AD[3:0] pins have internal pulldown. When left floating or pulled low the AD[3:0] = 0000'b, the device default address byte is 0xB0. Based on the SMBus 2.0 specification, the DS125BR401 has a 7-bit slave address. The LSB is set to 0'b (for a WRITE). The device supports up to 16 address byte, which can be set with the AD[3:0] inputs. [Table 9](#) shows the 16 addresses.

Table 9. Device Slave Address Bytes

AD[3:0] Settings	Address Bytes (HEX)
0000	B0
0001	B2
0010	B4
0011	B6
0100	B8
0101	BA
0110	BC
0111	BE
1000	C0
1001	C2
1010	C4
1011	C6
1100	C8
1101	CA
1110	CC
1111	CE

The SDA, SCL pins are 3.3-V tolerant, but are not 5-V tolerant. External pullup resistor is required on the SDA. The resistor value can be from 1 kΩ to 5 kΩ depending on the voltage, loading and speed. The SCL may also require an external pullup resistor and it depends on the Host that drives the bus.

9.5.3.1 Transfer of Data Through the SMBus

During normal operation the data on SDA must be stable during the time when SCL is High.

There are three unique states for the SMBus:

START: A High-to-Low transition on SDA while SCL is High indicates a message START condition.

STOP: A Low-to-High transition on SDA while SCL is High indicates a message STOP condition.

IDLE: If SCL and SDA are both High for a time exceeding t_{BUF} from the last detected STOP condition or if they are High for a total exceeding the maximum specification for t_{HIGH} then the bus will transfer to the IDLE state.

9.5.3.2 SMBus Transactions

The device supports WRITE and READ transactions. See [Table 10](#) for register address, type (Read/Write, Read Only), default value and function information.

9.5.3.3 Writing a Register

To write a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a "0" indicating a WRITE.
2. The Device (Slave) drives the ACK bit ("0").
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit ("0").

5. The Host drive the 8-bit data byte.
6. The Device drives an ACK bit ("0").
7. The Host drives a STOP condition.

The WRITE transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

9.5.3.4 Reading a Register

To read a register, the following protocol is used (see SMBus 2.0 specification).

1. The Host drives a START condition, the 7-bit SMBus address, and a 0 indicating a WRITE.
2. The Device (Slave) drives the ACK bit (0).
3. The Host drives the 8-bit Register Address.
4. The Device drives an ACK bit (0).
5. The Host drives a START condition.
6. The Host drives the 7-bit SMBus Address, and a 1 indicating a READ.
7. The Device drives an ACK bit 0.
8. The Device drives the 8-bit data value (register contents).
9. The Host drives a NACK bit 1 indicating end of the READ transfer.
10. The Host drives a STOP condition.

The READ transaction is completed, the bus goes IDLE and communication with other SMBus devices may now occur.

See [Table 10](#) for more information.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The DS125BR401 is a high performance circuit capable of delivering excellent performance. Careful attention must be paid to the details associated with high-speed design as well as providing a clean power supply. Refer to the following information and Revision 4 of the *LVDS Owner's Manual* for more detailed information on high-speed design tips to address signal integrity design issues.

10.2 Typical Application

The DS125BR401 works to extend the reach possible by using active equalization on the channel, boosting attenuated signals so that they can be more easily recovered at the Rx endpoint. The capability of the repeater can be explored across a range of data rates and ASIC-to-link-partner signaling, as shown in the following test setup connections. The test setup connections diagrams shown represent typical generic application scenarios for the DS125BR401.

Figure 9. Test Setup Connections Diagram

Figure 10. Test Setup Connections Diagram

10.2.1 Design Requirements

As with any high speed design, there are many factors which influence the overall performance. Below are a list of critical areas for consideration and study during design.

- Use 100-Ω impedance traces. Generally these are very loosely coupled to ease routing length differences.
- Place AC-coupling capacitors near to the receiver end of each channel segment to minimize reflections.
- The maximum body size for AC-coupling capacitors is 0402.
- Back-drill connector vias and signal vias to minimize stub length.
- Use Reference plane vias to ensure a low inductance path for the return current.

10.2.2 Detailed Design Procedure

The DS125BR401 is designed to be placed at a location where the input CTLE can help to compensate for a portion of the overall channel attenuation. In order to optimize performance, the repeater requires tuning to extend the reach of the cable or trace length while also recovering a solid eye opening. To tune the repeater, TI recommends the settings mentioned in [Table 2](#) and [Table 3](#) (for Pin Mode) as a default starting point for most applications. Once these settings are configured, additional tuning of the EQ and, to a lesser extent, VOD may be required to optimize the repeater performance for each specific application environment. Examples of the repeater performance as a generic high-speed datapath repeater are illustrated in the performance curves in the next section.

11 Power Supply Recommendations

11.1 3.3-V or 2.5-V Supply Mode Operation

The DS125BR401 has an optional internal voltage regulator to provide the 2.5-V supply to the device. In 3.3-V mode operation, the VIN pin = 3.3 V is used to supply power to the device. The internal regulator will provide the 2.5 V to the VDD pins of the device and a 0.1 μ F capacitor is needed at each of the 5 VDD pins for power supply decoupling (total capacitance should be ≤ 0.5 μ F), and the VDD_SEL pin must be tied to GND to enable the internal regulator. In 2.5-V mode operation, the VIN pin should be left open and the 2.5-V supply must be applied to the 5 VDD pins to power the device. The VDD_SEL pin must be left open (no connect) to disable the internal regulator.

Figure 25. 3.3-V or 2.5-V Supply Connection Diagram

11.2 Power Supply Bypassing

TI recommends two routing options to ensure that the DS125BR401 is provided with an adequate power supply. First, the supply (VDD) and ground (GND) pins should be connected to power planes routed on adjacent layers of the printed circuit board. The layer thickness of the dielectric should be minimized so that the V_{DD} and GND planes create a low inductance supply with distributed capacitance. Second, careful attention to supply bypassing through the proper use of bypass capacitors is required. A 0.1- μ F bypass capacitor should be connected to each V_{DD} pin such that the capacitor is placed as close as possible to the DS125BR401. Smaller body size capacitors can help facilitate proper component placement. Additionally, capacitor with capacitance in the range of 1 μ F to 10 μ F should be incorporated in the power supply bypassing design as well. These capacitors can be either tantalum or an ultra-low ESR ceramic.

12 Layout

12.1 Layout Guidelines

12.1.1 PCB Layout Considerations for Differential Pairs

The CML inputs and LPDS outputs have been optimized to work with interconnects using a controlled differential impedance of $85\ \Omega$ to $100\ \Omega$. It is preferable to route differential lines exclusively on one layer of the board, particularly for the input traces. The use of vias should be avoided if possible. If vias must be used, they should be used sparingly and must be placed symmetrically for each side of a given differential pair. Whenever differential vias are used the layout must also provide for a low inductance path for the return currents as well. Route the differential signals away from other signals and noise sources on the printed circuit board. See AN-1187 *Leadless Leadframe Package (LLP) Application Report (SNOA401)* for additional information on QFN (WQFN) packages.

Figure 26 depicts different transmission line topologies which can be used in various combinations to achieve the optimal system performance. Impedance discontinuities at the differential via can be minimized or eliminated by increasing the swell around each hole and providing for a low inductance return current path. When the via structure is associated with thick backplane PCB, further optimization such as back drilling is often used to reduce the detrimental high frequency effects of stubs on the signal path.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
