

## Compact LCD Bias IC with LDO, VCOM Buffer and Reset Function

### FEATURES

- 2.5V to 6.0V Input Voltage Range
- Up to 16.5V Boost Converter With 2A Switch Current
- 650kHz/1.2MHz Selectable Switching Frequency
- Adjustable Soft-Start for the Boost Converter
- 500mA LDO
- Reset Function ( $\overline{\text{XAO}}$  Signal)
- Regulated VGH
- Gate Voltage Shaping
- VCOM Buffer

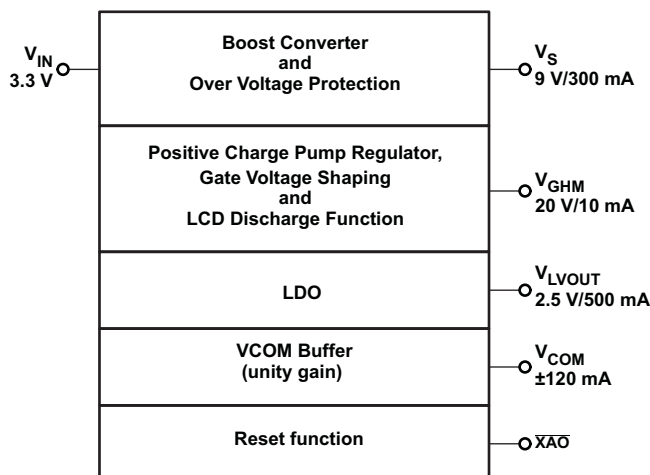

- LCD Discharge Function
- Overvoltage Protection
- Thermal Shutdown
- Undervoltage Lockout
- 24-Pin 4x4mm QFN Package

### APPLICATIONS

- Notebook PC
- Monitor

### DESCRIPTION

The TPS65146 offers a very compact power supply solution designed to supply the LCD bias voltages required by TFT (Thin Film Transistor) LCD panels running from a typical 3.3 V or 5 V supply rail. The device integrates a step-up converter for  $V_S$  (Source Driver voltage), a positive charge pump regulator for  $V_{GH}$  (Gate Driver High voltage), a logic voltage rail using an integrated LDO and a VCOM buffer driving the LCD backplane. In addition to that, a gate voltage shaping block is integrated for  $V_{GH}$ , modulating the signal (into  $V_{GHM}$ ) with high flexibility by using a logic input VFLK and an external discharge resistor connected to RE pin. Also, an external discrete negative charge pump can be set using the boost converter of the TPS65146 to generate  $V_{GL}$  (Gate Driver Low voltage). The integrated reset function together with the LCD discharge function available in the TPS65146 provide the signals enabling the discharge of the LCD TFT pixels when powering-off. The device includes safety features like overvoltage protection (OVP), as well as thermal shutdown.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

# TPS65146

SLVS869A–NOVEMBER 2008–REVISED JUNE 2009

[www.ti.com](http://www.ti.com)

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## ORDERING INFORMATION<sup>(1)</sup>

T <sub>A</sub>	ORDERING	PACKAGE	PACKAGE MARKING
–40°C to 85°C	TPS65146RGER	24-pin QFN	CEZ

- (1) The RGE package is available taped and reeled. For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website [www.ti.com](http://www.ti.com).

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) <sup>(1)</sup>

	VALUE	UNIT
Input voltage range V <sub>IN</sub> , LV <sub>IN</sub> <sup>(2)</sup>	–0.3 to 6.5	V
Voltage range on pins FB, SS, FREQ, COMP, ADJ, LVOUT, $\overline{\text{XAO}}$ , FBP, VDPM, VFLK, VDET, CDET <sup>(2)</sup>	–0.3 to 6.5	V
Voltage on pin SW, OPI, OPO, SUP, DRVP <sup>(2)</sup>	–0.3 to 20	V
Input voltage on VGH, VGHM, RE <sup>(2)</sup>	–0.3 to 35	V
ESD rating HBM	2	kV
ESD rating MM	200	V
ESD rating CDM	500	V
Continuous power dissipation	See Dissipation Rating Table	
Storage temperature range	–65 to 150	°C

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal.

## DISSIPATION RATINGS<sup>(1)(2)</sup>

PACKAGE	R <sub>θJA</sub>	T <sub>A</sub> ≤25°C POWER RATING	T <sub>A</sub> = 70°C POWER RATING	T <sub>A</sub> = 85°C POWER RATING
QFN	30°C/W	3.3 W	1.8 W	1.3 W

- (1)  $P_D = (T_J - T_A)/R_{\theta JA}$ .
- (2) R<sub>θJA</sub>, given for High-K PCB board.

## RECOMMENDED OPERATING CONDITIONS<sup>(1)(2)</sup>

over operating free-air temperature range (unless otherwise noted)

	MIN	TYP	MAX	UNIT
V <sub>IN</sub> , V <sub>LVIN</sub> Input voltage range, with V <sub>LVIN</sub> ≤ V <sub>IN</sub>	2.5		6.0	V
T <sub>A</sub> Operating ambient temperature	–40		85	°C
T <sub>J</sub> Operating junction temperature	–40		125	°C

- (1) Maximum output voltage limited by the Overvoltage Protection and not the maximum Power Switch rating.
- (2) Refer to application section for further information

## ELECTRICAL CHARACTERISTICS

$V_{IN} = V_{LVIN} = 3.3\text{ V}$ ,  $V_S = V_{SUP} = 9\text{ V}$ ,  $V_{LVOUT} = 2.5\text{ V}$ ,  $V_{GH} = 20\text{ V}$ ,  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ , typical values are at  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY</b>						
$V_{IN}$	Input voltage range		2.5		6.0	V
$I_{QIN}$	Operating quiescent current into VIN	Device not switching, $V_{FB} = 1.240\text{ V} + 3\%$		0.17	0.5	mA
$I_{QLVIN}$	Operating quiescent current into LVIN	$V_{ADJ} = 1.240\text{ V}$ , $V_{LVOUT} = \text{open}$ , no load		25	45	$\mu\text{A}$

(2) External pull-up resistor to be chosen so that the current flowing into  $\overline{XAO}$  Pin ( $V_{XAO} = 0\text{ V}$ ) when active is below  $I_{XAO\_MIN} = 1\text{ mA}$ .

(3) Maximum output voltage limited by the Overvoltage Protection and not the maximum power switch rating of the boost converter.

## PIN ASSIGNMENT

## TERMINAL FUNCTIONS

PIN		I/O	DESCRIPTION
NAME	NO.		
SW	1		Switch pin of the boost converter.
VIN	2	I	Input supply pin.
SS	3	I/O	Boost soft-start control pin. Connect a capacitor to this pin if a soft-start is needed. Open = no soft-start.
AGND	4, exposed pad		Analog ground.
ADJ	5	I	LDO feedback pin.
LVOUT	6	O	LDO output pin.
LVIN	7	I	LDO input supply pin.
VDET	8	I	Reset function threshold pin. Connect a voltage divider to this pin to set the threshold voltage.
$\overline{\text{XAO}}$	9	O	Reset function output pin (open-drain). $\overline{\text{XAO}}$ signal is active low.
CDET	10	I/O	Sets the reset delay time. Pin for external capacitor. Floating if no delay is needed.
VDPM	11	I/O	Sets the delay to enable VGHM Output. Pin for external capacitor. Floating if no delay needed.
VFLK	12	I	Input pin for charge/discharge signal for $V_{\text{GHM}}$ . VFLK = "high" discharges $V_{\text{GHM}}$ through RE pin.
RE	13		Slope adjustment pin for gate voltage shaping. Connect a resistor to this pin to set the discharging slope of $V_{\text{GHM}}$ when VFLK = "high".
VGHM	14	O	Gate voltage shaping output pin
VGH	15	I	Input pin for the positive charge pump voltage.
FBP	16	I	Positive charge pump feedback pin.
DRVP	17	O	Voltage driver pin of the positive charge pump.
SUP	18	I	Input supply pin for the gate voltage shaping and operational amplifier blocks. Also overvoltage protection sense pin. SUP pin must be supplied by $V_{\text{S}}$ voltage.
OPO	19	O	Output pin of the VCOM Buffer.
OPI	20	I	Input pin of the VCOM Buffer.
COMP	21	I/O	Boost converter compensation pin .
FB	22	I	Boost converter feedback pin.
FREQ	23	I	Boost converter frequency select pin. Oscillator is 650 kHz when FREQ is connected to GND and 1.2 MHz when FREQ is connected to VIN.
PGND	24		Power ground.

## APPLICATION INFORMATION

### BOOST CONVERTER

**Figure 19. Boost converter block diagram**

The boost converter is designed for output voltages up to 16.5 V with a switch peak current limit of 2.0 A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable between 650 kHz and 1.2 MHz and the minimum input voltage is 2.5 V. To limit the inrush current at start-up a soft-start pin is available.

During the on-time, the current rises into the inductor. When the current reaches a threshold value set by the internal GM amplifier, the power transistor is turned off. The polarity of the inductor changes and forward biases the Schottky diode which lets the current flow towards the output of the boost converter. The off-time is fixed for a certain  $V_{IN}$  and  $V_S$ , and therefore maintains the same frequency when varying these parameters.

However, for different output loads, the frequency slightly changes due to the voltage drop across the  $R_{DS(ON)}$  of the power transistor which will have an effect on the voltage across the inductor and thus on  $t_{ON}$  ( $t_{OFF}$  remains fixed).

The fixed off-time maintains a quasi-fixed frequency that provides better stability for the system over a wide range of input and output voltages than conventional boost converters. The TPS65146 topology has also the benefits of providing very good load and line regulations, and excellent line and load transient responses.

## Boost Converter Design Procedure

The first step in the design procedure is to verify whether the maximum possible output current of the boost converter supports the specific application requirements. A simple approach is to estimate the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst case assumption for the expected efficiency, e.g. 85%.

1. Duty Cycle:  $D = \frac{V_{IN} \times \eta}{V_S}$
2. Inductor ripple current:  $\Delta I_L = \frac{V_{IN} \times D}{f \times L}$
3. Maximum output current:  $I_{OUT\_max} = \left( I_{LIM\_min} - \frac{\Delta I_L}{2} \right) \times (1 - D)$
4. Peak switch Current:  $I_{swpeak} = \frac{\Delta I_L}{2} + \frac{I_{out}}{1 - D}$

$I_{swpeak}$  = converter switch current (must be <  $I_{LIM\_min} = 2.0$  A)

$f_S$  = Converter switching frequency (typically 1.2 MHz or 650 kHz)

$L$  = Selected inductor value (see the Inductor Selection section)

$\eta$  = Estimated converter efficiency (please use the number from the efficiency plots or 85% as an estimation)

$\Delta I_L$  = Inductor peak-to-peak ripple current

The peak switch current is the steady state peak switch current the integrated switch, inductor and external Schottky diode has to be able to handle. The calculation must be done for the minimum input voltage where the peak switch current is highest.

## Soft-Start (Boost Converter)

The boost converter has an adjustable soft-start to prevent high inrush current during start-up. To minimize the inrush current during start-up an external capacitor connected to the soft-start pin SS is used to slowly ramp up the internal current limit of the boost converter. When the  $V_{IN}$  exceeds the Undervoltage Lockout (UVLO) threshold, the soft-start capacitor  $C_{SS}$  is immediately charged up to 0.3 V. The capacitor is then charged at a constant current of 4  $\mu$ A typically until the output of the boost converter  $V_S$  has reached its Power Good threshold (90% of  $V_S$  nominal value). During this time, the voltage on SS pin directly controls the peak inductor current, starting with 0 A at  $V_{SS} = 0.3$  V up to the full current limit at  $V_{SS} \approx 800$  mV. The maximum load current is available after the soft-start is completed. The larger the capacitor, the slower the ramp of the current limit and the longer the soft-start time. A 100 nF capacitor is usually sufficient for most of the applications. When  $V_{IN}$  falls down below the UVLO level, the soft-start capacitor is discharged to ground.

## Frequency Select Pin (FREQ)

The digital frequency select pin FREQ allows to set the switching frequency of the device to 650 kHz (FREQ = low) or 1.2 MHz (FREQ = high). Higher switching frequency improves load transient response but reduces slightly the efficiency. The other benefits of higher switching frequency are a lower output voltage ripple. Usually, it is recommended to use 1.2 MHz switching frequency unless light load efficiency is a major concern.

## Inductor Selection

The main parameter for the inductor selection is the saturation current of the inductor which should be higher than the peak switch current as calculated above with additional margin to cover for heavy load transients. An alternative, more conservative, is to choose the inductor with a saturation current at least as high as the maximum switch current limit of 3.0 A. Another important parameter is the inductor DC resistance. Usually the lower the DC resistance the higher the efficiency. It is important to note that the inductor DC resistance is not the only parameter determining the efficiency. Especially for a boost converter where the inductor is the energy storage element, the type and core material of the inductor influences the efficiency as well. At high switching

frequencies of 1.2 MHz inductor core losses, proximity effects and skin effects become more important. Usually an inductor with a larger form factor gives higher efficiency. The efficiency difference between different inductors can vary between 2% to 10%. For the TPS65146, inductor values between 3.3  $\mu\text{H}$  and 6.8  $\mu\text{H}$  are a good choice with a switching frequency of 1.2 MHz. At 650 kHz we recommend inductors between 7  $\mu\text{H}$  and 13  $\mu\text{H}$ .  $I_{\text{sat}} \geq I_{\text{swpeak}}$  imperatively. Possible inductors are shown in [Table 1](#).

**Table 1. Inductor Selection**

L ( $\mu\text{H}$ )	COMPONENT SUPPLIER	COMPONENT CODE	SIZE (LxWxH mm)	DCR TYP (m $\Omega$ )	Isat (A)

### Rectifier Diode Selection

To achieve high efficiency a Schottky type should be used for the rectifier diode. The reverse voltage rating should be higher than the maximum output voltage of the converter. The averaged rectified forward current  $I_{\text{avg}}$ , the Schottky diode needs to be rated for, is equal to the output current  $I_{\text{OUT}}$ :

$$I_F = I_{\text{OUT}} \quad (1)$$

Usually a Schottky diode with 1 A to 1.5 A maximum average rectified forward current rating is sufficient for most of the applications. Also, the Schottky rectifier has to be able to dissipate the power. The dissipated power is the average rectified forward current  $I_F$  times the diode forward voltage  $V_F$  (or  $V_{\text{Diode}}$ ).

$$P_D = I_F \times V_F$$

Typically the diode should be able to dissipate around 500mW depending on the load current and forward voltage.

**Table 2. Rectifier Diode Selection**

CURRENT RATING $I_F$	$V_R$	$V_F / I_F$	COMPONENT SUPPLIER	COMPONENT CODE	PACKAGE TYPE
750 mA	20 V	0.425 V/750 mA	Fairchild Semiconductor	FYV0704S	SOT 23

# TPS65146

SLVS869A–NOVEMBER 2008–REVISED JUNE 2009

[www.ti.com](http://www.ti.com)

## Setting the Output Voltage

The output voltage is set by an external resistor divider. Typically, a minimum current of 50  $\mu\text{A}$  flowing through the feedback divider is enough to cover the noise fluctuation. The resistors are then calculated with 70  $\mu\text{A}$  as:

$$R2 = \frac{V_{FB}}{70 \mu\text{A}} \approx 18 \text{ k}\Omega$$

$$R1 = R2 \times \left( \frac{V_S}{V_{FB}} - 1 \right)$$

(2)

with  $V_{FB} = 1.240 \text{ V}$ 

## Compensation (COMP)

The regulation loop can be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier. The compensation capacitor will adjust the low frequency gain and the resistor value will adjust the high frequency gain. Lower output voltages require a higher gain and therefore a lower compensation capacitor value. A good start, that will work for the majority of the applications is  $C_{COMP} = 3.3 \text{ nF}$  and  $R_{COMP} = 18 \text{ k}\Omega$  for a 3.3 V input.

## Input Capacitor Selection

For good input voltage filtering low ESR ceramic capacitors are recommended. TPS65146 has an analog input VIN. A 1- $\mu\text{F}$  bypass is required as close as possible from VIN to GND.

One 10- $\mu\text{F}$  ceramic input capacitor is sufficient for most of the applications. For better input voltage filtering this value can be increased. Refer to [Table 3](#) and typical applications for input capacitor recommendations.

## Output Capacitor Selection

For best output voltage filtering a low ESR output capacitor is recommended. Two 10- $\mu\text{F}$  ceramic output capacitors work for most of the applications. Higher capacitor values can be used to improve the load transient response. Refer to [Table 3](#) for the selection of the output capacitor.

**Table 3. Rectifier Input and Output Capacitor Selection**

CAPACITOR	VOLTAGE RATING	COMPONENT SUPPLIER	COMPONENT CODE	COMMENTS
10 $\mu\text{F}/0805$	10 V	Taiyo Yuden	LMK212 BJ 106KD	$C_{IN}$
1 $\mu\text{F}/0603$	10 V	Taiyo Yuden	EMK107 BJ 105KA	VIN bypass
10 $\mu\text{F}/1206$	25 V	Taiyo Yuden	TMK316 BJ 106ML	$C_{OUT}$

To calculate the output voltage ripple that following equations can be used:

$$\Delta V_C = \frac{V_S - V_{IN}}{V_S \times f} \times \frac{I_{OUT}}{C} \quad \Delta V_{C\_ESR} = \Delta I_L \times R_{C\_ESR}$$

(3)

$\Delta V_{C\_ESR}$  can be neglected in many cases since ceramic capacitors provide very low ESR.

## Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages an undervoltage lockout is included that disables the device, if the input voltage falls below 2.0 V.

## Thermal shutdown

A thermal shutdown is implemented to prevent damages because of excessive heat and power dissipation. Typically the thermal shutdown threshold for the junction temperature is 150°C. When the thermal shutdown is triggered the device stops switching until the junction temperature falls below typically 136 °C. Then the device starts switching again.

## Overvoltage Protection

The boost converter has an integrated overvoltage protection to prevent the power switch from exceeding the absolute maximum switch voltage rating at pin SW in case the feedback (FB) pin is floating or shorted to GND. In such an event, the output voltage rises and is monitored with the overvoltage protection comparator over the SUP pin. As soon as the comparator trips at typically 18 V, the boost converter turns the N-Channel MOSFET switch off. The output voltage falls below the overvoltage threshold and the converter continues to operate. In order to detect overvoltage, the SUP pin needs to be connected to the output voltage of the boost converter  $V_S$ .

## LOW DROPOUT LINEAR REGULATOR (LDO)

The TPS65146 includes a Low Dropout Regulator providing the logic voltage to the panel. The LDO is designed to operate typically with a 1-μF ceramic output capacitor. The LDO has an internal softstart feature to limit the inrush current. A minimum current of 50 μA flowing through the feedback divider is usually enough to cover the noise fluctuation. The resistors of the voltage divider are then calculated with 70 μA as:

$$R4 = \frac{V_{ADJ}}{70 \mu A} \approx 18 \text{ k}\Omega$$

$$R3 = R4 \times \left( \frac{V_{LVOUT}}{V_{ADJ}} - 1 \right)$$

$$\text{with } V_{ADJ} = 1.240 \text{ V}$$

(4)

## REGULATED POSITIVE CHARGE PUMP

The positive charge pump sets the voltage applied on the V<sub>GH</sub> input pin, up to 32 V in tripler mode configuration. The charge pump block regulates the V<sub>GH</sub> voltage by adjusting the drive current I<sub>DRV</sub>. Typically, a minimum current of 50 μA flowing through the feedback divider is usually enough to cover the noise fluctuation. The resistors of the divider used to set the V<sub>GH</sub> voltage are calculated as:

$$R11 = \frac{V_{FBP}}{70 \mu A} \approx 18 \text{ k}\Omega$$

$$R10 = R11 \times \left( \frac{V_{GH}}{V_{FBP}} - 1 \right)$$

(5)

Figure 20. Positive Charge Pump regulator and Gate Voltage Shaping blocks

**Doubler Mode:** to use the positive Charge Pump in doubler mode configuration, the Schottky diode connected between the capacitor of DRVP pin and the 2.V<sub>S</sub> point has to be connected to the 3.V<sub>S</sub> point (see Figure 20).

**Tripler Mode:** since V<sub>GH</sub> pin is rated to maximum 32 V, the maximum output voltage of the boost converter (V<sub>S</sub>) possible is then limited to 11 V.

## POSTIVE CHARGE PUMP CURRENT CAPABILITY

The possible output current that the positive charge pump is able to deliver in doubler mode depends mainly on the headroom ( $2 \cdot V_S - V_{GH}$ ) and the internal voltage drop  $V_{drop\_internal}$ . The graph below (Figure 21) helps defining the headroom range that the system needs:

Figure 21.

Example:

For  $I_{GH} = 20$  mA, we refer to the “maximum  $I_{GH}$  possible” curve to determine the minimum headroom needed.

$$V_{headroom\_20mA} = 2 \cdot V_{SUP} - V_{GH} \geq V_{drop\_int\_20mA} + 2 \cdot V_{Diode}^* = 0.5 + 2V = 2.5V \quad (6)$$

\* in the case where  $V_{Diode} = 1$  V

This means that the headroom in this example must be more than 2.5 V to be able to source 20 mA at the output of the positive charge pump.

However, generating a too large headroom can lead to excessive power dissipation. The dashed curves show the internal power dissipation generated by a certain internal voltage drop. In the above example, if  $V_{headroom\_20mA} = 7$  V (with  $V_{Diode} = 1$  V),  $V_{drop\_internal\_min} = 5$  V and the internal power dissipation  $P_{DISS\_INTERNAL}$  for the positive charge pump would reach 100 mW. The power dissipation of the charge pump block needs to be taken into account for the overall power dissipation rating.

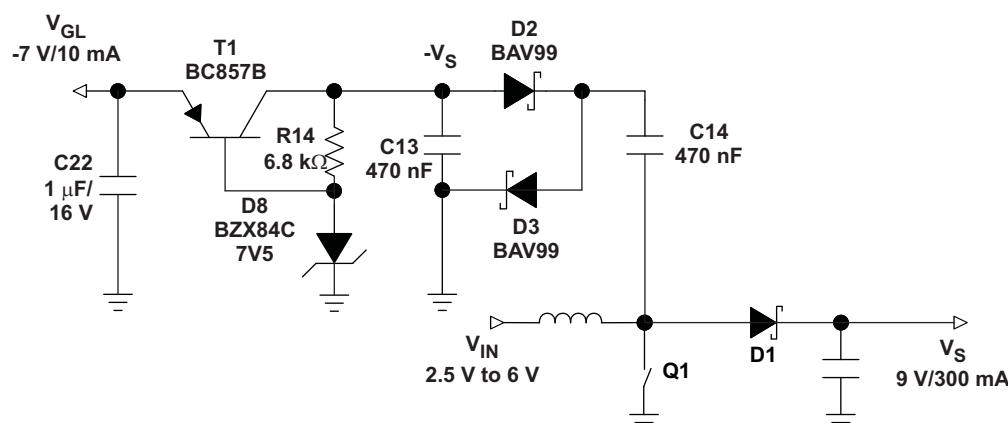

### NOTE:

refer to the power rating table not to exceed the overall maximum package power dissipation allowed.

## EXTERNAL NEGATIVE CHARGE PUMP

The external negative charge pump works with two stages (charge pump and regulation). The charge pump provides a negative regulated output voltage. Figure 22 shows the operation details of the negative charge pump. With the first stage, the voltage on the collector of the bipolar transistor is equal to  $-V_S + V_D$ .

The next stage regulates the output voltage  $V_{GL}$ . A resistor and a Zener diode are used to clamp the voltage to the desired output value. The bipolar transistor is used to provide better load regulation as well as to reduce the quiescent current. The output voltage on  $V_{GL}$  will be equal to  $-V_Z - V_{be}$ .

**Figure 22. Partially Regulated External Negative**

### Capacitors (Charge Pumps)

For best output voltage filtering a low ESR output capacitor is recommended. Ceramic capacitors have a low ESR value but depending on the application tantalum capacitors can be used as well. For every capacitor, the reactance value has to be calculated as follows:

$$X_C = \frac{1}{2 \times \pi \times f \times C} \quad (7)$$

This value should be as low as possible in order to reduce the voltage drop due to the current flowing through it. The rated voltage of the capacitor has to be able to withstand the voltage across it. Capacitors rated at 50 V are enough for most of the applications. Typically a 470-nF capacitance is sufficient for the flying capacitors whereas bigger values like 1 μF or more can be used for the output capacitors to reduce the output voltage ripple.

CAPACITOR	COMPONENT SUPPLIER	COMPONENT CODE	COMMENTS
100 nF/0603	Taiyo Yuden	UMK107 BJ 104KA	Flying Cap
470 nF/0805	Taiyo Yuden	UMK212 BJ 474KG	Output Cap 1
1 μF/1210	Taiyo Yuden	UMK325 BJ 105KH	Output Cap 2

### Diodes (Charge Pumps)

For high efficiency, one has to minimize the forward voltage drop of the diodes. Schottky diodes are recommended. The reverse voltage rating must withstand the maximum output voltage  $V_S$  of the boost converter. Usually a Schottky diode with 200 mA average forward rectified current is suitable for most of the applications.

CURRENT RATING $I_{avg}$	$V_r$	$V_{forward} / I_{avg}$	COMPONENT SUPPLIER	COMPONENT CODE	PACKAGE TYPE
200 mA	30 V	0.5 V / 30mA	International Rectifier	BAT54S	SOT 23

## GATE VOLTAGE SHAPING FUNCTION

### Sequencing

At start-up, the VGHM output is enabled once VDPM voltage is higher than  $V_{ref} = 1.240$  V. The capacitor connected to VDPM pin sets a delay from the Power Good signal of the boost converter.

$$C_{VDPM} = \frac{I_{DPM} \times t_{DPM}}{V_{ref}} = \frac{20 \mu A \times t_{DPM}}{1.240 V} \quad (8)$$

At power off, VGHM is connected to VGH as soon as VIN reaches the threshold voltage of the reset function.

### Setting the Discharge Slope for Gate Voltage Shaping

VFLK = 'high' → VGHM discharges to 0V

VFLK = 'low' → VGHM = VGH

The slope at which VGHM discharges is set by the external resistor connected to RE, the internal MOSFET RDS(ON) (typ. 13Ω for M2 – see block diagram below) and by the external gate line capacitance connected to VGHM pin.

**Figure 23. Gate Voltage Shaping Timing**

If VFLK = 'high' and RE is connected with a resistor to ground (see Figure 23), VGHM will discharge from VGH to 0V. Since  $5 \times \tau$  ( $\tau = R \times C$ ) are needed to fully discharge C through R, we can define the time-constant of the gate voltage shaping block as follow:

$$\tau = (R_e + R_{DS(ON)M2}) \times C_{VGHM}$$

Therefore, if the discharge of C<sub>VGHM</sub> should finish during VFLK = 'high':

$$t_{discharge} = 5 \times \tau = t_{V_{FLK} = 'high'} \Rightarrow RE = \frac{t_{V_{FLK} = 'high'}}{5 \times C_{VGHM}} - R_{DS(ON)M2} \quad (9)$$

**Figure 24. Discharge Path Options for VGHM**

Options 2 and 3 from Figure 24 work like option 1 explained above. When M2 is turned on, VGHM discharges with a slope set by Re from VGH level down to Vs in option 2 configuration and in option 3 configuration down to the voltage set by the resistor divider. The discharging slope is set by Re resistor(s).

#### NOTE:

when options 2 or 3 are used, VGHM is not held to 0V at startup but to the voltage set on RE pin by the resistors Re and Re'.

## VCOM BUFFER

The VCOM Buffer power supply pin is the SUP pin connected to the boost converter  $V_S$ . To achieve good performance and minimize the output noise, a 1- $\mu$ F ceramic bypass capacitor is required directly from the SUP pin to ground. The buffer is not designed to drive high capacitive loads; therefore it is recommended to connect a series resistor at the output to provide stable operation when driving high capacitive load. With a 3.3- $\Omega$  series resistor, a capacitive load of 10 nF can be driven, which is usually sufficient for typical LCD applications.

## RESET FUNCTION

The device has an integrated reset function with an open drain output capable of sinking 1 mA. The reset function monitors the voltage applied to its sense input VDET. As soon as the voltage on VDET falls below the threshold voltage ( $V_{DET}$ ) of typically 1.1 V, the reset function asserts its reset signal by pulling  $\overline{XAO}$  low. Typically, a minimum current of 50  $\mu$ A flowing through the feedback divider is enough to cover the noise fluctuation. Therefore, to select R6, one has to set the input voltage limit ( $V_{IN\_LIM}$ ) at which the reset function will pull  $\overline{XAO}$  to low state.  $V_{IN\_LIM}$  must be higher than the UVLO threshold.

$$R7 = \frac{V_{DET}}{70 \mu A} \approx 18 \text{ k}\Omega$$

$$R6 = R7 \times \left( \frac{V_{IN\_LIM}}{1.1 \text{ V}} - 1 \right)$$

(10)

with  $V_{DET} = 1.1 \text{ V}$

When the input voltage  $V_{IN}$  rises, once the voltage on VDET pin exceeds its threshold voltage plus hysteresis the  $\overline{XAO}$  signal will go high after the delay time set by the capacitor connected to CDET.

$$C_{DET} = \frac{10 \mu A \times t_{DET}}{1.240 \text{ V}}$$

(11)

The reset function is operational for  $V_{IN} \geq 1.6 \text{ V}$ .

**Figure 25. Voltage Detection and  $\overline{XAO}$  Pin**

The reset function is configured as a standard open-drain and requires a pull-up resistor. The resistor  $R_{\overline{XAO}}$  (R5) which must be connected between the  $\overline{XAO}$  pin and a positive voltage  $V_X$  greater than 2V - 'high' logic level - e.g.  $V_{LVOUT}$ , can be chosen as follows:

$$R_{\overline{XAO\_min}} > \frac{V_X}{1 \text{ mA}} \quad \& \quad R_{\overline{XAO\_max}} < \frac{V_X - 2 \text{ V}}{2 \mu A}$$

(12)

## Power on sequencing

Once the input voltage  $V_{IN}$  reaches the Under Voltage Lockout (UVLO), the device is internally enabled and the LDO starts rising. When  $V_{LVOUT}$  of the LDO is at its Power Good voltage, the boost converter, as well as the Vcom buffer are enabled. As soon as  $V_S$  of the boost converter reaches its Power Good (90% of its nominal value), the positive charge pump block is enabled. Then the capacitor connected to VDPM is charged, setting the gate voltage shaping block delay time, and finally enables the VGHM signal.

1. LDO
2. Boost converter & VCOM Buffer
3. VGH and VDPM (delay time to enable the gate voltage shaping function)
4. VGHM (after proper delay)

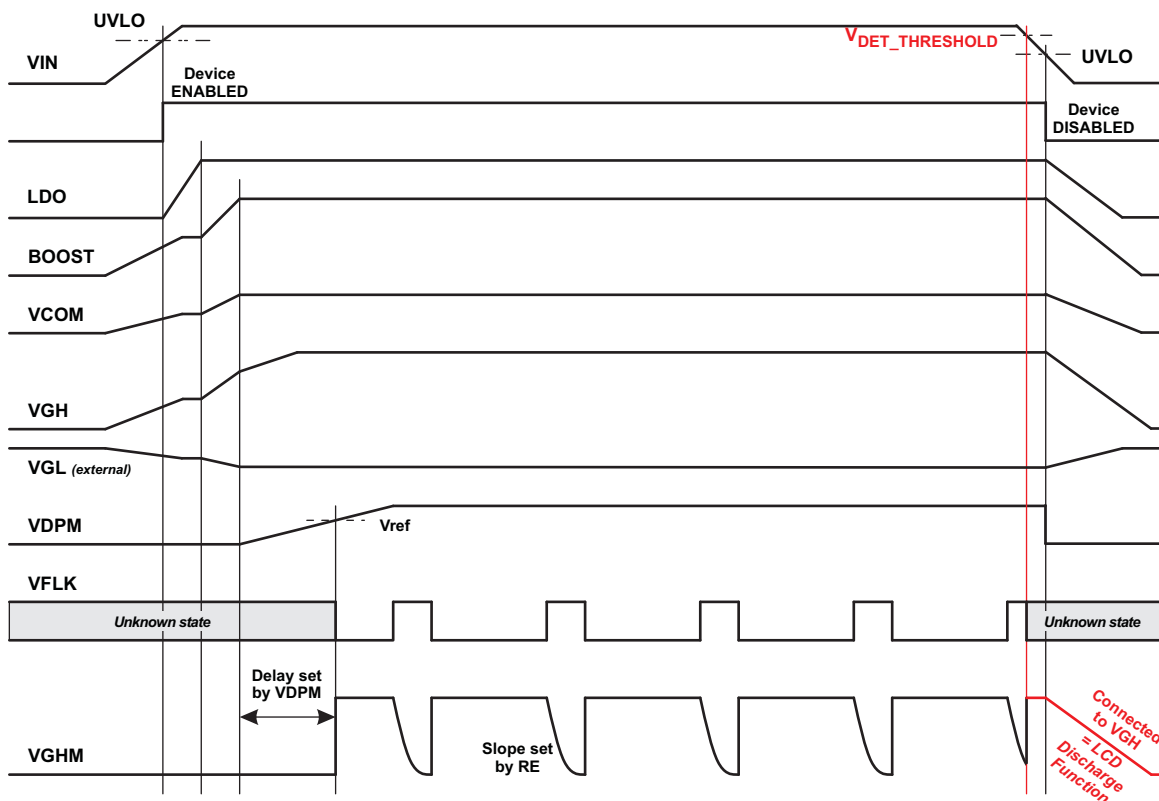

Figure 26. Sequencing TPS65146

## Power off sequencing and LCD discharge function

When the input voltage  $V_{IN}$  falls below a predefined threshold (set by  $V_{DET\_THRESHOLD}$  - see Figure 26),  $\overline{XAO}$  is driven low and  $V_{GHM}$  is driven to  $V_{GH}$ . (Note that when  $V_{IN}$  falls below the UVLO threshold, all IC functions are disabled except  $\overline{XAO}$  and  $V_{GHM}$ ). Since  $V_{GHM}$  is connected to  $V_{GH}$ , it tracks the output of the positive charge pump as it decays. This feature, together with  $\overline{XAO}$  can be used to discharge the panel by turning on all the pixel TFTs and discharging them into the gradually decaying  $V_{GHM}$  voltage.  $V_{GHM}$  is held low during power-up.

## APPLICATION INFORMATION

Figure 27. TPS65146 Typical Application with Positive Charge Pump in Doubler Mode Configuration

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65146RGER	ACTIVE	VQFN	RGE	24	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	CEZ	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
