DLP470NE 0.47 1080P DMD

Technical

Documents

ŧ٦

- 1 特性
- 0.47 英寸对角线微镜阵列
 - 全高清/1080P (1920 x 1080)
 - 5.4 微米微镜间距
 - ±17°微镜倾斜(相对于平坦表面)
 - 底部照明
- 2xLVDS 输入数据总线
- 通过专用的 DLPC4422 显示控制器、DLPA100 电 源管理 IC 和电机驱动器实现可靠运行
- 2 应用
- 全高清 (1080P) 显示
- 激光电视
- 移动智能电视
- 数字标牌
- 游戏
- 家庭影院

3 说明

🧷 Tools &

Software

TI DLP470NE 数字微镜器件 (DMD) 是一款数控微机 电系统 (MEMS) 空间照明调制器 (SLM),可用于实现 高亮的全高清显示系统。DLP470NE DMD 的尺寸仅为 0.47 英寸,但能够提供高达 4000 流明的高亮度图像 和视频。DLP470NE DMD 与 DLPC4422 显示控制器 和 DLPA100 电源及电机驱动器一起,组成了 DLP[®]0.47" 1080P 芯片组。此解决方案非常适合许多 高亮度 1080P/高清显示系统。

5 Pin Configuration and Functions

CAUTION

To ensure reliable, long-term operation of the .47" 1080P s410 DMD, it is critical to properly manage the layout and operation of the signals identified in the table below. For specific details and guidelines, refer to the *PCB Design Requirements for TI DLP Standard TRP Digital Micromirror Devices* application report before designing the board.

⁽¹⁾ The .47" 1080P TRP 2xLVDS Series 410 DMD is a component of one or more DLP chipsets. Reliable function and operation of the .47" 1080P TRP 2xLVDS Series 410 DMD requires that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD control technology. TI DMD control technology is the TI technology and devices for operating or controlling a DLP DMD. I = Input, O = Output, P = Power, G = Ground, NC = No connect

DLP470NE ZHCSKH6A – APRIL 2019–REVISED NOVEMBER 2019

www.ti.com.cn

Pin Functions⁽¹⁾ (continued)

PIN		(2)		ΠΑΤΑ	INTERNAL		TRACE
NAME	NO.	I/O ⁽²⁾	O ^(*) SIGNAL RATE TERMINATION DESCRIPTION		LENGTH (mil)		
VOFFSET ⁽³⁾	A30, B2, M30, Z1, Z30	Р	Analog			Supply voltage for HVCMOS logic. Supply voltage for positive offset level of micromirror reset signal. Supply voltage for stepped high voltage at micromirror address electrodes.	
VCC ⁽³⁾	A24, A7, B10, B13, B16, B19, B22, B28, B5, C17, C20, D4, J29, K2, L29, M2, N27, U27, V13, V15, V22, W17, W21, W26, W29, W3, Z18, Z23, Z29, Z7	Ρ	Analog			Supply voltage for LVCMOS core. Supply voltage for positive offset level of micromirror reset signal during Power down. Supply voltage for normal high level at micromirror address electrodes.	
VSS ⁽⁴⁾	A13, A22, A23, B12, B14, B15, B20, B23, B26, B29, B3, B6, B9, C19, C21, C5, D2, G2, J28, K3, L28, L30, M3, P27, P29, U29, V21, V23, V26, W12, W16, W18, W2, W22, W25, W28, W30, W5, W8, Z21, Z22, Z24	G				Device ground. Common return for all power.	

(4) V_{SS} must be connected for proper DMD operation.

Specifications 6

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted). Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device is not implied at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure above or below the Recommended Operating Conditions for extended periods may affect device reliability.

		MIN	MAX	UNIT
SUPPLY VOLTAGE	S			
V _{CC}	Supply voltage for LVCMOS core logic ⁽¹⁾	-0.5	2.3	V
V _{OFFSET}	Supply voltage for HVCMOS and micromirror electrode ⁽¹⁾⁽²⁾	-0.5	11	V
V _{BIAS}	Supply voltage for micromirror electrode ⁽¹⁾	-0.5	19	V
V _{RESET}	Supply voltage for micromirror electrode ⁽¹⁾	-15	-0.3	V
V _{BIAS} – V _{OFFSET}	Supply voltage difference (absolute value) ⁽³⁾		11	V
V _{BIAS} – V _{RESET}	Supply voltage difference (absolute value) ⁽⁴⁾		34	V
INPUT VOLTAGES				
	Input voltage for all other LVCMOS input pins ⁽¹⁾	-0.5	V _{CC} + 0.5	V
V _{ID}	Input differential voltage (absolute value) ⁽⁵⁾		500	mV
I _{ID}	Input differential current ⁽⁶⁾		6.3	mA
Clocks				
f _{clock}	Clock frequency for LVDS interface, DCLK_C		400	MHz
f _{clock}	Clock frequency for LVDS interface, DCLK_D		400	MHz
ENVIRONMENTAL				
T _{ARRAY} and	Temperature, operating ⁽⁷⁾	0	90	°C
TWINDOW	Temperature, non-operating ⁽⁷⁾	-40	90	°C
T _{DELTA}	Absolute temperature delta between any point on the window edge and the ceramic test point TP1 $^{\rm (8)}$		30	°C
T _{DP}	Dew Point Temperature, operating and non-operating (noncondensing)		81	°C

(1) All voltages are referenced to common ground V_{SS}. V_{BIAS}, V_{CC}, V_{OFFSET}, and V_{RESET} power supplies are all required for proper DMD operation. V_{SS} must also be connected.

VOFESET supply transients must fall within specified voltages.

Exceeding the recommended allowable voltage difference between V_{BIAS} and V_{OFFSET} may result in excessive current draw. Exceeding the recommended allowable voltage difference between V_{BIAS} and V_{RESET} may result in excessive current draw. This maximum LVDS input voltage rating applies when each input of a differential pair is at the same voltage potential. (3)

(4)

(5)

LVDS differential inputs must not exceed the specified limit or damage may result to the internal termination resistors. (6)

The highest temperature of the active array (as calculated using Micromirror Array Temperature Calculation) or of any point along the window edge as defined in Figure 11. The locations of thermal test points TP2, TP3, TP4 and TP5 in Figure 11 are intended to measure the highest window edge temperature. If a particular application causes another point on the window edge to be at a higher temperature, that point should be used.

Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge as shown in (8) Figure 11. The window test points TP2, TP3, TP4 and TP5 shown in Figure 11 are intended to result in the worst case delta. If a particular application causes another point on the window edge to result in a larger delta temperature, that point should be used.

6.2 Storage Conditions

Applicable for the DMD as a component or non-operating in a system.

		MIN	MAX	UNIT
T _{DMD}	DMD storage temperature	-40	80	°C
T _{DP-AVG}	Average dew point temperature, (non-condensing) ⁽¹⁾		28	°C
T _{DP-ELR}	Elevated dew point temperature range, (non-condensing) ⁽²⁾	28	36	°C
CT _{ELR}	Cumulative time in elevated dew point temperature range		24	Months

(1) The average over time (including storage and operating) that the device is not in the elevated dew point temperature range.

Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative (2)time of CT_{ELR}.

6.3 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	M
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±500	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.4 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted). The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by this table. No level of performance is implied when operating the device above or below these limits.

		MIN	NOM	MAX	UNIT
VOLTAGE SUPP	LY				
V _{CC}	LVCMOS logic supply voltage ⁽¹⁾	1.65	1.8	1.95	V
V _{OFFSET}	Mirror electrode and HVCMOS voltage ⁽¹⁾⁽²⁾	9.5	10	10.5	V
V _{BIAS}	Mirror electrode voltage ⁽¹⁾	17.5	18	18.5	V
V _{RESET}	Mirror electrode voltage ⁽¹⁾	-14.5	-14	-13.5	V
V _{BIAS} – V _{OFFSET}	Supply voltage difference (absolute value) ⁽³⁾			10.5	V
$ V_{BIAS} - V_{RESET} $	Supply voltage difference (absolute value) ⁽⁴⁾			33	V
LVCMOS INTER	FACE				
V _{IH(DC)}	DC input high voltage ⁽⁵⁾	$0.7 \times V_{CC}$		V _{CC} + 0.3	V
V _{IL(DC)}	DC input low voltage ⁽⁵⁾	-0.3		$0.3 \times V_{CC}$	V
V _{IH(AC)}	AC input high voltage ⁽⁵⁾	$0.8 \times V_{CC}$		V _{CC} + 0.3	V
V _{IL(AC)}	AC input low voltage ⁽⁵⁾	-0.3		$0.2 \times V_{CC}$	V
t _{PWRDNZ}	PWRDNZ pulse duration ⁽⁶⁾	10			ns
SCP INTERFACE	E				
<i>f</i> scpclk	SCP clock frequency ⁽⁷⁾			500	kHz
t _{SCP_PD}	Propagation delay, Clock to Q, from rising–edge of SCPCLK to valid SCPDO $^{(8)}$	0		900	ns
t _{SCP_NEG_ENZ}	Time between falling-edge of SCPENZ and the first rising- edge of SCPCLK	1			μs
t _{SCP_POS_ENZ}	Time between falling-edge of SCPCLK and the rising-edge of SCPENZ	1			μs
t _{SCP_DS}	SCPDI Clock setup time (before SCPCLK falling edge) ⁽⁸⁾	800			ns
t _{SCP_DH}	SCPDI Hold time (after SCPCLK falling edge) ⁽⁸⁾	900			ns
t _{SCP_PW_ENZ}	SCPENZ inactive pulse duration (high level)	2			μs

 All voltages are referenced to common ground VSS. VBIAS, VCC, VOFFSET, and VRESET power supplies are all required for proper DMD operation. VSS must also be connected.

(2) VOFFSET supply transients must fall within specified max voltages.

(3) To prevent excess current, the supply voltage difference |VBIAS – VOFFSET| must be less than specified limit. See *Power Supply Recommendations*, Figure 15, and Table 8.

(4) To prevent excess current, the supply voltage difference |VBIAS – VRESET| must be less than specified limit. See Power Supply Recommendations, Figure 15, and Table 8.

(5) Low-speed interface is LPSDR and adheres to the Electrical Characteristics and AC/DC Operating Conditions table in JEDEC Standard No. 209B, "Low-Power Double Data Rate (LPDDR)" JESD209B.Tester Conditions for VIH and VIL.
 (a) Frequency = 60 MHz. Maximum Rise Time = 2.5 ns @ (20% - 80%)

(b) Frequency = 60 MHz. Maximum Fall Time = 2.5 ns @ (80% - 20%)

(6) PWRDNZ input pin resets the SCP and disables the LVDS receivers. PWRDNZ input pin overrides SCPENZ input pin and tristates the SCPDO output pin.

(7) The SCP clock is a gated clock. Duty cycle must be 50% ± 10%. SCP parameter is related to the frequency of DCLK.

(8) See Figure 2.

Recommended Operating Conditions (continued)

Over operating free-air temperature range (unless otherwise noted). The functional performance of the device specified in this data sheet is achieved when operating the device within the limits defined by this table. No level of performance is implied when operating the device above or below these limits.

		MIN	NOM	MAX	UNIT

^I ARRAY	Array temperature, short-term operational ⁽¹²⁾⁽¹⁵⁾	0		10	°C
T _{WINDOW}	Window temperature – operational ⁽¹⁶⁾⁽¹⁷⁾			85	°C
T _{delta}	Absolute temperature delta between any point on the window edge and the ceramic test point TP1 $^{\rm (18)(19)}$			14	°C
T _{DP -AVG}	Average dew point temperature (non-condensing) ⁽²⁰⁾			28	°C
T _{DP-ELR}	Elevated dew point temperature range (non-condensing) ⁽²¹⁾	28		36	°C
CT _{ELR}	Cumulative time in elevated dew point temperature range			24	Months
L	Operating system luminance (19)			4000	lm
ILL _{UV}	Illumination wavelengths < 395 $nm^{(11)}$		0.68	2.00	mW/cm ²
ILL _{VIS}	Illumination wavelengths between 395 nm and 800 nm	The	rmally limit	ed	mW/cm ²
ILL _{IR}	Illumination wavelengths > 800 nm			10	mW/cm ²
ILL _θ	Illumination marginal ray angle ⁽¹⁷⁾			55	deg

(9) See LVDS Timing Requirements in *Timing Requirements* and Figure 6.

(10) See Figure 5 LVDS Waveform Requirements.

(11) Simultaneous exposure of the DMD to the maximum *Recommended Operating Conditions* for temperature and UV illumination reduces device lifetime.

(12) The array temperature cannot be measured directly and must be computed analytically from the temperature measured at test point 1 (TP1) shown in Figure 11 and the package thermal resistance using the *Micromirror Array Temperature Calculation*.

(13) Long-term is defined as the usable life of the device.

(14) Per Figure 1, the maximum operational array temperature should be derated based on the micromirror landed duty cycle that the DMD experiences in the end application. See *Micromirror Landed-On/Landed-Off Duty Cycle* for a definition of micromirror landed duty cycle.

(15) Array temperatures beyond those specified as long-term are recommended for short-term conditions only (power-up). Short-term is defined as cumulative time over the usable life of the device and is less than 500 hours.

(16) The locations of thermal test points TP2, TP3, TP4 and TP5 in Figure 10 are intended to measure the highest window edge temperature. For most applications, the locations shown are representative of the highest window edge temperature. If a particular application causes additional points on the window edge to be at a higher temperature, test points should be added to those locations.

- (17) The maximum marginal ray angle of the incoming illumination light at any point in the micromirror array, including Pond of Micromirrors (POM), should not exceed 55 degrees from the normal to the device array plane. The device window aperture has not necessarily been designed to allow incoming light at higher maximum angles to pass to the micromirrors, and the device performance has not been tested nor qualified at angles exceeding this. Illumination light exceeding this angle outside the micromirror array (including POM) will contribute to thermal limitations described in this document, and may negatively affect lifetime.
- (18) Temperature delta is the highest difference between the ceramic test point 1 (TP1) and anywhere on the window edge as shown in Figure 11. The window test points TP2, TP3, TP4 and TP5 shown in Figure 11 are intended to result in the worst case delta temperature. If a particular application causes another point on the window edge to result in a larger delta in temperature, that point should be used.
- (19) DMD is qualified at the combination of the maximum temperature and maximum lumens specified. Operation of the DMD outside of these limits has not been tested.
- (20) The average over time (including storage and operating) that the device is not in the 'elevated dew point temperature range.
- (21) Exposure to dew point temperatures in the elevated range during storage and operation should be limited to less than a total cumulative time of CT_{ELR}.

6.5 Thermal Information

	DLP470NE	
THERMAL METRIC	FXH Package	UNIT
	257 PINS	
Thermal resistance, active area to test point 1 (TP1) ⁽¹⁾	0.90	°C/W

(1) The DMD is designed to conduct absorbed and dissipated heat to the back of the package. The cooling system must be capable of maintaining the package within the temperature range specified in the *Recommended Operating Conditions*.

The total heat load on the DMD is largely driven by the incident light absorbed by the active area; although other contributions include light energy absorbed by the window aperture and electrical power dissipation of the array.

Optical systems should be designed to minimize the light energy falling outside the window clear aperture since any additional thermal load in this area can significantly degrade the reliability of the device.

Window Transmittance, average over the wavelength range 420 nm and 680 nm. Applies to all angles 30° –45° AOI. ⁽¹⁾ ⁽²⁾	97%	

(1) Single-pass through both surfaces and glass.

(2) Angle of incidence (AOI) is the angle between an incident ray and the normal to a reflecting or refracting surface.

6.13 Chipset Component Usage Specification

Reliable function and operation of the DLP470NE DMD requires that it be used in conjunction with the other components of the applicable DLP chipset, including those components that contain or implement TI DMD control technology. TI DMD control technology is the TI technology and devices for operating or controlling a DLP DMD.

7 Detailed Description

7.1 Overview

The DMD is a 0.47 inch diagonal spatial light modulator which consists of an array of highly reflective aluminum micromirrors. The DMD is an electrical input, optical output micro-electrical-mechanical system (MEMS). The electrical interface is Low Voltage Differential Signaling (LVDS). The DMD consists of a two-dimensional array of 1-bit CMOS memory cells. The array is organized in a grid of M memory cell columns by N memory cell rows. Refer to the *Functional Block Diagram*. The positive or negative deflection angle of the micromirrors can be individually controlled by changing the address voltage of underlying CMOS addressing circuitry and micromirror reset signals (MBRST).

The DLP470NE DMD is part of the chipset comprising of the DLP470NE DMD, the DLPC4422 display controller and the DLPA100 power and motor driver. To ensure reliable operation, the DLP470NE DMD must always be used with the DLPC4422 display controller and the DLPA100 power and motor driver.

7.2 Functional Block Diagram

For pin details on Channels C, and D, refer to *Pin Configurations and Functions* and LVDS Interface section of *Timing Requirements*.

Figure 10. Functional Block Diagram

7.3 Feature Description

7.3.1 Power Interface

The DMD requires 5 DC voltages: DMD_P3P3V, DMD_P1P8V, VOFFSET, VRESET, and VBIAS. DMD_P3P3V is created by the DLPA100 power and motor driver and is used on the DMD board to create the other 4 DMD voltages, as well as powering various peripherals (TMP411, I2C, and TI level translators). DMD_P1P8V is created by the TI PMIC LP38513S and provides the VCC voltage required by the DMD. VOFFSET (10V), VRESET (-14V), and VBIAS(18V) are made by the TI PMIC TPS65145 and are supplied to the DMD to control the micromirrors.

7.3.2 Timing

The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. Figure 4 shows an equivalent test load circuit for the output under test. Timing reference loads are not intended as a precise representation of any particular system environment or depiction of the actual load presented by a production test. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. The load capacitance value stated is only for characterization and measurement of AC timing signals. This load capacitance value does not indicate the maximum load the device is capable of driving.

7.4 Device Functional Modes

DMD functional modes are controlled by the DLPC4422 display controller. See the DLPC4422 display controller data sheet or contact a TI applications engineer.

7.5 Optical Interface and System Image Quality Considerations

TI assumes no responsibility for end-equipment optical performance. Achieving the desired end-equipment optical performance involves making trade-offs between numerous component and system design parameters. System optical performance and image quality strongly relate to optical system design parameter trade offs. Although it is not possible to anticipate every conceivable application, projector image quality and optical performance is contingent on compliance to the optical system operating conditions described in the following sections.

7.5.1 Numerical Aperture and Stray Light Control

The angle defined by the numerical aperture of the illumination and projection optics at the DMD optical area should be the same. This angle should not exceed the nominal device micromirror tilt angle unless appropriate apertures are added in the illumination and/or projection pupils to block out flat-state and stray light from the projection lens. The micromirror tilt angle defines DMD capability to separate the "ON" optical path from any other light path, including undesirable flat-state specular reflections from the DMD window, DMD border structures, or other system surfaces near the DMD such as prism or lens surfaces. If the numerical aperture exceeds the micromirror tilt angle, or if the projection numerical aperture angle is more than two degrees larger than the illumination numerical aperture angle (and vice versa), contrast degradation, and objectionable artifacts in the display border and/or active area could occur.

7.5.2 Pupil Match

TI's optical and image quality specifications assume that the exit pupil of the illumination optics is nominally centered within 2° of the entrance pupil of the projection optics. Misalignment of pupils can create objectionable artifacts in the display border and/or active area, which may require additional system apertures to control, especially if the numerical aperture of the system exceeds the pixel tilt angle.

7.5.3 Illumination Overfill

The active area of the device is surrounded by an aperture on the inside DMD window surface that masks structures of the DMD chip assembly from normal view, and is sized to anticipate several optical operating conditions. Overfill light illuminating the window aperture can create artifacts from the edge of the window aperture opening and other surface anomalies that may be visible on the screen. The illumination optical system should be designed to limit light flux incident anywhere on the window aperture from exceeding approximately 10% of the average flux level in the active area. Depending on the particular system optical architecture, overfill light may have to be further reduced below the suggested 10% level in order to be acceptable.

7.6 Micromirror Array Temperature Calculation

Figure 11. DMD Thermal Test Points

Micromirror Array Temperature Calculation (continued)

Micromirror array temperature can be computed analytically from measurement points on the outside of the package, the package thermal resistance, the electrical power, and the illumination heat load. The relationship between micromirror array temperature and the reference ceramic temperature is provided by the following equations:

 $T_{ARRAY} = T_{CERAMIC} + (Q_{ARRAY} \times R_{ARRAY-TO-CERAMIC})$

 $Q_{ARRAY} = Q_{ELECTRICAL} + (Q_{ILLUMINATION})$

where

- T_{ARRAY} = computed array temperature (°C)
- T_{CERAMIC} = measured ceramic temperature (°C) (TP1 location)
- R_{ARRAY-TO-CERAMIC} = thermal resistance of package from array to ceramic TP1 (°C/Watt)
- Q_{ARRAY} = Total DMD power on the array (Watts) (electrical + absorbed)
- Q_{ELECTRICAL} = nominal electrical power
- $Q_{ILLUMINATION} = (C_{L2W} \times SL)$
- C_{L2W} = Conversion constant for screen lumens to power on DMD (Watts/Lumen)
- SL = measured screen lumens

The electrical power dissipation of the DMD is variable and depends on the voltages, data rates and operating frequencies. A nominal electrical power dissipation to use when calculating array temperature is 0.9 Watts. The absorbed power from the illumination source is variable and depends on the operating state of the micromirrors and the intensity of the light source. The equations shown above are valid for a 1-Chip DMD system with projection efficiency from the DMD to the screen of 87%.

The conversion constant CL2W is based on array characteristics. It assumes a spectral efficiency of 300 lumens/Watt for the projected light and illumination distribution of 83.7% on the active array, and 16.3% on the array border.

Sample calculations for typical projection application:

$$\begin{split} & \mathsf{Q}_{\mathsf{ELECTRICAL}} = 0.9 \text{ W} \\ & \mathsf{C}_{\mathsf{L2W}} = 0.00266 \\ & \mathsf{SL} = 4000 \text{ Im} \\ & \mathsf{T}_{\mathsf{CERAMIC}} = 55.0^{\circ}\mathsf{C} \\ & \mathsf{Q}_{\mathsf{ARRAY}} = 0.9 \text{ W} + (0.00266 \times 4000 \text{ Im}) = 11.54 \text{ W} \\ & \mathsf{T}_{\mathsf{ARRAY}} = 55.0^{\circ}\mathsf{C} + (11.54 \text{ W} \times 0.90^{\circ}\mathsf{C}/\mathsf{W}) = 65.39^{\circ}\mathsf{C} \end{split}$$

7.7 Micromirror Landed-On/Landed-Off Duty Cycle

7.7.1 Definition of Micromirror Landed-On/Landed-Off Duty Cycle

The micromirror landed-on/landed-off duty cycle (landed duty cycle) denotes the amount of time (as a percentage) that an individual micromirror is landed in the On state versus the amount of time the same micromirror is landed in the OFF state.

As an example, a landed duty cycle of 100/0 indicates that the referenced pixel is in the ON state 100% of the time (and in the Off state 0% of the time); whereas 0/100 would indicate that the pixel is in the OFF state 100% of the time. Likewise, 50/50 indicates that the pixel is ON for 50% of the time (and OFF for 50% of the time).

Note that when assessing landed duty cycle, the time spent switching from one state (ON or OFF) to the other state (OFF or ON) is considered negligible and is thus ignored.

Since a micromirror can only be landed in one state or the other (ON or OFF), the two numbers (percentages) always add to 100.

Micromirror Landed-On/Landed-Off Duty Cycle (continued)

7.7.2 Landed Duty Cycle and Useful Life of the DMD

Knowing the long-term average landed duty cycle (of the end product or application) is important because subjecting all (or a portion) of the DMD micromirror array (also called the active array) to an asymmetric landed duty cycle for a prolonged period of time can reduce the DMD usable life.

Note that it is the symmetry/asymmetry of the landed duty cycle that is of relevance. The symmetry of the landed duty cycle is determined by how close the two numbers (percentages) are to being equal. For example, a landed duty cycle of 50/50 is perfectly symmetrical whereas a landed duty cycle of 100/0 or 0/100 is perfectly asymmetrical.

7.7.3 Landed Duty Cycle and Operational DMD Temperature

Operational DMD temperature and landed duty cycle interact to affect DMD usable life, and this interaction can be exploited to reduce the impact that an asymmetrical landed duty cycle has on the DMD usable life. This is quantified in the de-rating curve shown in Figure 1. The importance of this curve is that:

- All points along this curve represent the same usable life.
- All points above this curve represent lower usable life (and the further away from the curve, the lower the usable life).
- All points below this curve represent higher usable life (and the further away from the curve, the higher the usable life).

In practice, this curve specifies the maximum operating DMD Temperature at a given long-term average Landed Duty Cycle.

7.7.4 Estimating the Long-Term Average Landed Duty Cycle of a Product or Application

During a given period of time, the Landed Duty Cycle of a given pixel follows from the image content being displayed by that pixel.

For example, in the simplest case, when displaying pure-white on a given pixel for a given time period, that pixel operates under a 100/0 Landed Duty Cycle during that time period. Likewise, when displaying pure-black, the pixel operates under a 0/100 Landed Duty Cycle.

Between the two extremes (ignoring for the moment color and any image processing that may be applied to an incoming image), the Landed Duty Cycle tracks one-to-one with the gray scale value, as shown in Table 5.

GRAYSCALE VALUE	LANDED DUTY CYCLE
0%	0/100
10%	10/90
20%	20/80
30%	30/70
40%	40/60
50%	50/50
60%	60/40
70%	70/30
80%	80/20
90%	90/10
100%	100/0

Table 5. Grayscale Value and Landed Duty Cycle

Accounting for color rendition (but still ignoring image processing) requires knowing both the color intensity (from 0% to 100%) for each constituent primary color (red, green, and/or blue) for the given pixel as well as the color cycle time for each primary color, where "color cycle time" is the total percentage of the frame time that a given primary must be displayed in order to achieve the desired white point.

Use the following equation to calculate the landed duty cycle of a given pixel during a given time period

Landed Duty Cycle = (Red_Cycle_% × Red_Scale_Value) + (Green_Cycle_% × Green_Scale_Value) + (Blue_Cycle_% × Blue_Scale_Value)

where

- Red_Cycle_%, represents the percentage of the frame time that red is displayed to achieve the desired white point
- Green_Cycle_% represents the percentage of the frame time that green is displayed to achieve the desired white point
- Blue_Cycle_%, represents the percentage of the frame time that blue is displayed to achieve the desired white point

For example, assume that the red, green and blue color cycle times are 50%, 20%, and 30% respectively (in order to achieve the desired white point), then the Landed Duty Cycle for various combinations of red, green, blue color intensities would be as shown in Table 6 and Table 7.

Table 6. Example Landed Duty Cycle for Full-Color, Color Percentage

CYCLE PERCENTAGE					
RED	GREEN	BLUE			
50%	20%	30%			

Table 7. Example Landed Duty Cycle for Full-Color

S	SCALE VALUE						
RED	GREEN	BLUE	CYCLE				
0%	0%	0%	0/100				
100%	0%	0%	50/50				
0%	100%	0%	20/80				
0%	0%	100%	30/70				
12%	0%	0%	6/94				
0%	35%	0%	7/93				
0%	0%	60%	18/82				
100%	100%	0%	70/30				
0%	100%	100%	50/50				
100%	0%	100%	80/20				
12%	35%	0%	13/87				
0%	35%	60%	25/75				
12%	0%	60%	24/76				
100%	100%	100%	100/0				

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

Texas Instruments DLP technology is a micro-electro-mechanical systems (MEMS) technology that modulates light using a digital micromirror device (DMD). The DMD is a spatial light modulator, which reflects incoming light from an illumination source to one of two directions, towards the projection optics or collection optics. Typical applications using the DLP470NE include home theater, digital signage, interactive display, low-latency gaming display, portable smart displays.

The most recent class of chipsets from Texas Instruments is based on a breakthrough micromirror technology, called TRP. With a smaller pixel pitch of 5.4 μ m and increased tilt angle of 17 degrees, TRP chipsets enable higher resolution in a smaller form factor and enhanced image processing features while maintaining high optical efficiency. DLP chipsets are a great fit for any system that requires high resolution and high brightness displays.

8.2 Typical Application

The DLP470NE DMD combined with a DLPC4422 digital controller and DLPA100 power management device provides full HD resolution for bright, colorful display applications. A typical display system using the DLP470NE and additional system components is shown in Figure 12.

DLP470NE ZHCSKH6A – APRIL 2019–REVISED NOVEMBER 2019

Figure 12. Typical 1080P Application Diagram

Texas Instruments

8.2.1 Design Requirements

A DLP470NE projection system is created by using the DMD chipset, including the DLP470NE, DLPC4422, and DLPA100. The DLP470NE is used as the core imaging device in the display system and contains a 0.47-inch array of micromirrors. The DLPC4422 controller is the digital interface between the DMD and the rest of the system, taking digital input from front end receiver and driving the DMD over a high speed interface. The DLPA100 power management device provides voltage regulators for the DMD, controller, and illumination functionality.

Other core components of the display system include an illumination source, an optical engine for the illumination and projection optics, other electrical and mechanical components, and software. The illumination source options include lamp, LED, laser or laser phosphor. The type of illumination used and desired brightness will have a major effect on the overall system design and size.

8.2.2 Detailed Design Procedure

For connecting the DLPC4422 display controller and the DLP470NE DMD, see the reference design schematic. For a complete DLP system, an optical module or light engine is required that contains the DLP470NE DMD, associated illumination sources, optical elements, and necessary mechanical components.

To ensure reliable operation, the DLP470NE DMD must always be used with the DLPC4422 display controller and a DLPA100 PMIC driver. Refer to PCB Design Requirements for DLP Standard TRP Digital Micromirror Devices for the DMD board design and manufacturing handling of the DMD sub assemblies.

8.2.3 Application Curves

When LED illumination is utilized, typical LED-current-to-Luminance relationship is shown in Figure 13

Figure 13. Luminance vs. Current

8.3 DMD Die Temperature Sensing

The DMD features a built-in thermal diode that measures the temperature at one corner of the die outside the micromirror array. The thermal diode can be interfaced with the TMP411 temperature sensor as shown in Figure 14. The serial bus from the TMP411 can be connected to the DLPC4422 display controller to enable its temperature sensing features. See the DLPC4422 Programmers' Guide for instructions on installing the DLPC4422 controller support firmware bundle and obtaining the temperature readings.

The software application contains functions to configure the TMP411 to read the DMD temperature sensor diode. This data can be leveraged to incorporate additional functionality in the overall system design such as adjusting illumination, fan speeds, and so forth. All communication between the TMP411 and the DLPC4422 controller will be completed using the I²C interface. The TMP411 connects to the DMD via pins B17 and B18 as outlined in *Pin Configuration and Functions*.

DMD Die Temperature Sensing (continued)

(1) Details omitted for clarity, see the TI Reference Design for connections to the DLPC4422 controller.

(2) See the TMP411 datasheet for system board layout recommendation.

(3) See the TMP411 datasheet and the TI reference design for suggested component values for R1, R2, R3, R4, and C1.

(4) $R5 = 0 \Omega$. $R6 = 0 \Omega$. Zero ohm resistors should be located close to the DMD package pins.

Figure 14. TMP411 Sample Schematic

9 Power Supply Recommendations

The following power supplies are all required to operate the DMD:

- VSS
- VBIAS
- VCC
- VOFFSET
- VRESET

DMD power-up and power-down sequencing is strictly controlled by the DLP display controller.

CAUTION

For reliable operation of the DMD, the following power supply sequencing requirements must be followed. Failure to adhere to any of the prescribed power-up and power-down requirements may affect device reliability. See Figure 15 DMD Power Supply Sequencing Requirements.

VBIAS, VCC, VOFFSET, and VRESET power supplies must be coordinated during power-up and power-down operations. Failure to meet any of the below requirements will result in a significant reduction in the DMD reliability and lifetime. Common ground VSS must also be connected.

9.1 DMD Power Supply Power-Up Procedure

- During power-up, VCC must always start and settle before VOFFSET plus Delay1 specified in Table 8, VBIAS, and VRESET voltages are applied to the DMD.
- During power-up, it is a strict requirement that the voltage difference between VBIAS and VOFFSET must be within the specified limit shown in *Recommended Operating Conditions*.
- During power-up, there is no requirement for the relative timing of VRESET with respect to VBIAS.
- Power supply slew rates during power-up are flexible, provided that the transient voltage levels follow the requirements specified in *Absolute Maximum Ratings*, in *Recommended Operating Conditions*, and in Figure 15.
- During power-up, LVCMOS input pins must not be driven high until after VCC have settled at operating voltages listed in *Recommended Operating Conditions*.

9.2 DMD Power Supply Power-Down Procedure

- During power-down, VCC must be supplied until after VBIAS, VRESET, and VOFFSET are discharged to within the specified limit of ground. See Table 8.
- During power-down, it is a strict requirement that the voltage difference between VBIAS and VOFFSET must be within the specified limit shown in *Recommended Operating Conditions*.
- During power-down, there is no requirement for the relative timing of VRESET with respect to VBIAS.
- Power supply slew rates during power-down are flexible, provided that the transient voltage levels follow the requirements specified in *Absolute Maximum Ratings*, in *Recommended Operating Conditions*, and in Figure 15.
- During power-down, LVCMOS input pins must be less than specified in *Recommended Operating Conditions*.

DMD Power Supply Power-Down Procedure (continued)

- (1) See Recommended Operating Conditions, and .
- (2) To prevent excess current, the supply voltage difference |VOFFSET VBIAS| must be less than specified limit in .*Recommended Operating Conditions*
- (3) To prevent excess current, the supply difference |VBIAS VRESET| must be less than specified limit in *.Recommended Operating Conditions.*
- (4) VBIAS should power up after VOFFSET has powered up, per the Delay1 specification in Table 8
- (5) PG_OFFSET should turn off after EN_OFFSET has turned off, per the Delay2 specification in Table 8.
- (6) DLP controller software enables the DMD power supplies to turn on after RESET_OEZ is at logic high.
- (7) DLP controller software initiates the global VBIAS command.
- (8) After the DMD micromirror park sequence is complete, the DLP controller software initiates a hardware power-down that activates PWRDNZ and disables VBIAS, VRESET and VOFFSET.
- (9) Under power-loss conditions where emergency DMD micromirror park procedures are being enacted by the DLP controller hardware, EN_OFFSET may turn off after PG_OFFSET has turned off. The OEZ signal goes high prior to PG_OFFSET turning off to indicate the DMD micromirror has completed the emergency park procedures.

Figure 15. DMD Power Supply Requirements

DMD Power Supply Power-Down Procedure (continued)

PARAMETER	DESCRIPTION	MIN	NOM	MAX	UNIT
Delay1	Delay from VOFFSET settled at recommended operating voltage to VBIAS and VRESET power up	1	2		ms
Delay2	PG_OFFSET hold time after EN_OFFSET goes low	100			ns

10 Layout

10.1 Layout Guidelines

The DLP470NE DMD is part of a chipset that is controlled by the DLPC4422 display controller in conjunction with the DLPA100 power and motor driver. These guidelines are targeted at designing a PCB board with the DLP470NE DMD. The DLP470NE DMD board is a high-speed multi-layer PCB, with primarily high-speed digital logic utilizing dual edge clock rates up to 400MHz for DMD LVDS signals. The remaining traces are comprised of low speed digital LVTTL signals. TI recommends that mini power planes are used for VOFFSET, VRESET, and VBIAS. Solid planes are required for DMD_P3P3V(3.3V), DMD_P1P8V and Ground. The target impedance for the PCB is 50 $\Omega \pm 10\%$ with the LVDS traces being 100 $\Omega \pm 10\%$ differential. TI recommends using an 8 layer stack-up as described in Table 9.

10.2 Layout Example

10.2.1 Layers

The layer stack-up and copper weight for each layer is shown in Table 9. Small sub-planes are allowed on signal routing layers to connect components to major sub-planes on top/bottom layers if necessary.

LAYER NO.	LAYER NAME	COPPER WT. (oz.)	COMMENTS
1	Side A - DMD only	1.5	DMD, escapes, low frequency signals, power sub-planes.
2	Ground	1	Solid ground plane (net GND).
3	Signal	0.5	50 Ω and 100 Ω differential signals
4	Ground	1	Solid ground plane (net GND)
5	DMD_P3P3V	1	+3.3-V power plane (net DMD_P3P3V)
6	Signal	0.5	50 Ω and 100 Ω differential signals
7	Ground	1	Solid ground plane (net GND).
8	Side B - All other Components	1.5	Discrete components, low frequency signals, power sub-planes

Table 9. Layer Stack-Up

10.2.2 Impedance Requirements

TI recommends that the board has matched impedance of 50 Ω ±10% for all signals. The exceptions are listed in Table 10.

Signal Type	Signal Name	Impedance (ohms)
	DDCP(0:15), DDCN(0:15)	
C channel LVDS differential pairs	B DCLKC_P, DCLKC_N 100 ±10% differ	
	SCTRL_CP, SCTRL_CN	
	DDDP(0:15), DDDN(0:15)	
D channel LVDS differential pairs	DCLKD_P, DCLKD_N	100 ±10% differential across
	SCTRL_DP, SCTRL_DN	

Table 10. Special Impedance Requirements

DLP470NE ZHCSKH6A – APRIL 2019 – REVISED NOVEMBER 2019

10.2.3 Trace Width, Spacing

Unless otherwise specified, TI recommends that all signals follow the 0.005"/0.005" design rule. Minimum trace clearance from the ground ring around the PWB has a 0.1" minimum. An analysis of impedance and stack-up requirements determine the actual trace widths and clearances.

10.2.3.1 Voltage Signals

SIGNAL NAME	MINIMUM TRACE WIDTH TO PINS (MIL)	LAYOUT REQUIREMENT
GND	15	Maximize trace width to connecting pin
DMD_P3P3V	15	Maximize trace width to connecting pin
DMD_P1P8V	15	Maximize trace width to connecting pin
VOFFSET	15	Create mini plane from U2 to U3
VRESET	15	Create mini plane from U2 to U3
VBIAS	15	Create mini plane from U2 to U3
All U3 control connections	10	Use 10 mil etch to connect all signals/voltages to DMD pads

Table 11. Special Trace Widths, Spacing Requirements

11 器件和文档支持

11.1 器件支持

11.1.1 器件命名规则

图 16. 器件型号 说明

11.1.2 器件标记

器件标记包括人类可读的信息和二维矩阵码。图 17 中显示了人类可读信息。二维矩阵码是一个字母数字字符串, 其中包含 DMD 部件号、序列号的第 1 部分和第 2 部分。DMD 序列号(第 1 部分)的首字符为制造年份。DMD 序列号(第 1 部分)的第二个字符为制造月份。DMD 序列号(第 2 部分)的最后一个字符为偏置电压二进制字 母。

示例: *1910-543AB GHXXXXX LLLLLLM

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DLP470NEAAFXH	ACTIVE	CLGA	FXH	257	33	RoHS & Green	Call TI	N / A for Pkg Type			Samples

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

⁽⁵⁾ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
